2010 I WORLD DEVELOPMENT INDICATORS

PREFACE

The 1998 edition of *World Development Indicators* initiated a series of annual reports on progress toward the International Development Goals. In the foreword then–World Bank President James D. Wolfensohn recognized that "by reporting regularly and systematically on progress toward the targets the international community has set for itself, we will focus attention on the task ahead and make those responsible for advancing the development agenda accountable for results." The same vision inspired world leaders to commit themselves to the Millennium Development Goals. On this, the 10th anniversary of the Millennium Declaration, *World Development Indicators 2010* focuses on progress toward the Millennium Development Goals and the challenges of meeting them.

There has been remarkable progress.

Despite the global financial crisis, poverty rates in developing countries continue to fall, with every likelihood of reaching and then exceeding the Millennium Development Goals target in most regions of the world. Since the turn of the century, 37 million more children have enrolled in primary school. Measles immunization rates have risen to 81 percent, with similar progress in other vaccination programs and health-related services. Since 2000 the number of children dying before age 5 has fallen from more than 10 million a year to 8.8 million.

So, much progress. But we still have far to go. Global and regional averages cannot disguise the large differences between countries. Average annual incomes range from \$280 to more than \$60,000 per person. Life expectancy ranges from 44 years to 83 years. And differences within countries can be even greater. But we should not be discouraged. Nor should we conclude that the effort has failed just because some countries will fall short of the targets. The Millennium Development Goals have helped to focus development efforts where they will do the most good and have created new demand for good statistics.

Responding to the demand for statistics to monitor progress on the Millennium Development Goals, developing countries and donor agencies have invested in statistical systems, conducted more frequent surveys, and improved methodologies. And the results are beginning to show in the pages of *World Development Indicators*. But here too our success makes us keenly aware of the need to do more to enrich the quality of development statistics.

And we are just as committed to making them more widely available. With the release of the 2010 edition of *World Development Indicators*, the World Bank is redesigning its Web sites and making its development databases freely and fully accessible. As always, we invite your ideas and innovations in putting statistics in service to people.

Shaida Badiee Director Development Economics Data Group

ACKNOWLEDGMENTS

This book and its companion volumes, *The Little Data Book* and *The Little Green Data Book*, are prepared by a team led by Soong Sup Lee under the supervision of Eric Swanson and comprising Awatif Abuzeid, Mehdi Akhlaghi, Azita Amjadi, Uranbileg Batjargal, David Cieslikowski, Loveena Dookhony, Richard Fix, Shota Hatakeyama, Masako Hiraga, Kiyomi Horiuchi, Bala Bhaskar Naidu Kalimili, Buyant Erdene Khaltarkhuu, Alison Kwong, K. Sarwar Lateef, Ibrahim Levent, Raymond Muhula, Changqing Sun, K.M. Vijayalakshmi, and Estela Zamora, working closely with other teams in the Development Economics Vice Presidency's Development Data Group. The electronic products were prepared with contributions from Azita Amjadi, Ramvel Chandrasekaran, Ying Chi, Jean-Pierre Djomalieu, Ramgopal Erabelly, Reza Farivari, Shelley Fu, Gytis Kanchas, Buyant Erdene Khaltarkhuu, Ugendran Makhachkala, Vilas Mandlekar, Nacer Megherbi, Parastoo Oloumi, Abarna Panchapakesan, William Prince, Sujay Ramasamy, Malarvizhi Veerappan, and Vera Wen. The work was carried out under the management of Shaida Badiee. Valuable advice was provided by Shahrokh Fardoust.

The choice of indicators and text content was shaped through close consultation with and substantial contributions from staff in the World Bank's four thematic networks—Sustainable Development, Human Development, Poverty Reduction and Economic Management, and Financial and Private Sector Development—and staff of the International Finance Corporation and the Multilateral Investment Guarantee Agency. Most important, the team received substantial help, guidance, and data from external partners. For individual acknowledgments of contributions to the book's content, please see *Credits*. For a listing of our key partners, see *Partners*.

Communications Development Incorporated provided overall design direction, editing, and layout, led by Meta de Coquereaumont, Bruce Ross-Larson, and Christopher Trott. Elaine Wilson created the cover and graphics and typeset the book. Joseph Caponio provided production assistance. Communications Development's London partner, Peter Grundy of Peter Grundy Art & Design, designed the report. Staff from External Affairs oversaw printing and dissemination of the book.

2.10	Assessing vulnerability and security	98
2.11	Education inputs	102
2.12	Participation in education	106
2.13	Education efficiency	110
2.14	Education completion and outcomes	114
2.15	Education gaps by income and gender	118
2.16	Health services	120
2.10 2.17	Health information	124
2.17 2.18		
	Disease prevention coverage and quality	128
2.19	Reproductive health	132
2.20	Nutrition	136
2.21	Health risk factors and future challenges	140
2.22	Mortality	144
	Text figures, tables, and boxes	
2a	Child mortality is higher among the poorest children	53
2b	as is child malnutrition	53
20 20		
26 2d	The poorest women have the least access to prenatal care	54
Zű	Poor and rural children are less likely to complete primary	F 4
0-	school	54
2e	and more likely to be out of school	54
2f	Poorer children are more likely to die before age 5	54
2 g	and to be out of school	54
2h	First-line health facilities in many countries lack electricity	
	and clean water	55
2 i	Fewer health facilities in Guinea had electricity in 2001 than in	
	1998, but more had running water	55
2 j	Availability of child health services is weak in Egypt and Rwanda	55
2k	Wealthy people have better access to child health services	56
21	Absenteeism among health workers reduces access to health car	e 56
2m	Distribution of health workers in Zambia , 2004	56
2n	Many schools lack electricity, blackboards, seating, and libraries	57
20	Absenteeism is high among teachers in some poor countries,	
	2002–03	57
2 p	The cost of education	57
2q	Public expenditures on primary education, by region, 2004	58
2r	Available data on human development indicators vary by region	58
2s	In many regions fewer than half of births are reported to the	50
20		59
2 t	United Nations Statistics Division	
	and even fewer child deaths are reported	59
2U 2v	Out of school children are difficult to measure	59
2v	Out-of-pocket health care costs are too high for many people	00
0	to afford	60
2W	Informal payments to health care providers are common	60
2x	Primary school enrollment and attendance, 2003–08	61
2 y	Instructional time for children varies considerably by country,	
	2004–06	61
2.6 a	Brazil has rapidly reduced children's employment and raised	
	school attendance	85
2.8 a	While the number of people living on less than \$1.25 a day has	
	fallen, the number living on \$1.25–\$2.00 a day has increased	91
2.8b	Poverty rates have begun to fall	91
2.8c	Regional poverty estimates	92
2.9 a	The Gini coefficient and ratio of income or consumption of the	
	richest quintile to the poorest quintiles are closely correlated	97
2.12a	The situations of out of school children vary widely	109
2.15a	Gender disparities in net primary school attendance are	
	largest in poor and rural households	119
	.a. goot poor and rarai nodociloido	0

3. ENVIRONMENT

	Introduction	149
	Tables	
3.1	Rural population and land use	154
3.2	Agricultural inputs	158
3.3	Agricultural output and productivity	162
3.4	Deforestation and biodiversity	166
3.5	Freshwater	170
3.6	Water pollution	174
3.7	Energy production and use	178
3.8	Energy dependency and efficiency and carbon dioxide emissions	182
3.9	Trends in greenhouse gas emissions	186
3.10	Sources of electricity	190
3.11	Urbanization	194
3.12	Urban housing conditions	198
3.13	Traffic and congestion	202
3.14	Air pollution	206
3.15	Government commitment	208
3.16	Toward a broader measure of savings	212
	Text figures, tables, and boxes	
3a	Carbon dioxide is the most common greenhouse gas	149
3b	Carbon dioxide emissions have surged since the 1950s	150
3c	Carbon dioxide emissions are growing, 1990–2006	150
3d	A few rapidly developing and high-income countries produce	
	70 percent of carbon dioxide emissions	150
3e	Trends in fossil fuel use and energy intensity	151
3f	Emission reductions by 2030	151
3 g	Future energy use under the IEA-450 scenario	151
3h	People affected by natural disasters and projected changes in	
	rainfall and agricultural production	152
3i	Potential contributions of the water sector to attaining the	
	Millennium Development Goals	153
3.1a	What is rural? Urban?	157

3.2a	Nearly 40 percent of land globally is devoted to agriculture	161
3.2b	Developing regions lag in agricultural machinery, which	
	reduces their agricultural productivity	161
3.3a	Cereal yield in low-income economies is less than	
	40 percent of the yield in high-income countries	165
3.3b	Sub-Saharan Africa has the lowest yield, while East Asia	
	and Pacific is closing the gap with high-income economies	165
3.5a	Agriculture is still the largest user of water, accounting for	
	some 70 percent of global withdrawals in 2007	173
3.5b	and approaching 90 percent in some developing regions	
	in 2007	173
3.6a	Emissions of organic water pollutants declined in most	
	economies from 1990 to 2006, even in some of the top emitters	177
3.7a	A person in a high-income economy uses more than 12 times as	
	much energy on average as a person in a low-income economy	181
3.8a	High-income economies depend on imported energy	185
3.8b	mostly from middle-income economies in the Middle East	
	and North Africa and Latin America and the Caribbean	185
3.9a	The 10 largest contributors to methane emissions account	
	for about 62 percent of emissions	189
3.9b	The 10 largest contributors to nitrous oxide emissions	
	account for about 56 percent of emissions	189
3.10a	Sources of electricity generation have shifted since 1990	193
3.10b	with developing economies relying more on coal	193
3.11a	Urban population nearly doubled in low- and lower	
	middle-income economies between 1990 and 2008	197
3.11b	Latin America and the Caribbean had the same share of	
	urban population as high-income economies in 2008	197
3.12a	Selected housing indicators for smaller economies	201
3.13a	Particulate matter concentration has fallen in all income groups	,
	and the higher the income, the lower the concentration	205

	members	410
6.18	Movement of people	414
6.19	Travel and tourism	418
<u></u>	Text figures, tables, and boxes	
<u>6a</u>	Growth of exports and growth of GDP go hand in hand	346
6b	Export revenues are increasingly larger portions of low-income	
<u></u>	economies' GDP	347
6c	Developing economies' share in world exports has	
	increased, especially for large middle-income economies	347
6d	Low-income economies specialize in labor-intensive exports	347
6e	Labor-intensive products face higher tariffs than other	
<u></u>	commodities	348
6f	Low-income economies have a small share in the global	
<u></u>	agricultural market	348
6g	Developing economies are trading more with other developing	
	economies	348
6h	For some developing economies only five products make up	
	more than 90 percent of total merchandise exports	349

6i	Nontariff barriers on imports may be higher than tariff barriers	349
6j	Agricultural exports from low-income economies face the	
	highest overall restrictions	349
6k	Some OECD members apply very high tariffs selectively	350
61	Growth of trade in services peaked in the last three years	350
6m	Developing economies expanded their share in the world	
	tourism industry	351
6n	Remittances have become an important source of external	
<u></u>	financing for low- and middle-income economies	351
60	Logistics performance is lowest for low-income economies	352
<u>6p</u>	Challenges for landlocked economies	353
6q	Lead time to import and export is	
	longest for low-income economies	353
6.1a	Services trade has not grown as rapidly as merchandise trade	357
6.3a	Trade among developing economies has grown faster than	
	trade among high-income economies	364
6.4a	High-income economies export mostly manufactured goods	
<u></u>	to low- and middle-income economies	367
6.5a	Developing economies are increasingly trading with other	
<u></u>	developing economies in the same region	370
6.6a	Primary commodity prices have been volatile over the past	
<u></u>	two years	373
6.7a	The number of trade agreements has increased rapidly	
	since 1990, especially agreements between high-income	
	economies and developing economies and agreements	
	among developing economies	377
6.10a	Debt flows from private creditors to low- and middle-income	
0.44-	economies fell sharply in 2008	389
6.11a	The burden of external debt service declined over 2000–08	393
6.12a	Most global foreign direct investment is directed to high-	
0.40-	income economies and a few large middle-income economies	397
6.13a	Net lending from the International Bank for Reconstruction	
	and Development declined as countries paid off loans, and	
	concessional lending from the International Development	
0.40-	Association increased	401
6.16a	Official development assistance from non-DAC donors, 2004–08	409
6.17a	Destination of aid varies by donor	413
6.19a	High-income economies remain the main recipients of	
	increased international tourism expenditure, but the share	
	of developing economies' receipts has risen	421

PARTNERS

Defining, gathering, and disseminating international statistics is a collective effort of many people and organizations. The indicators presented in *World Development Indicators* are the fruit of decades of work at many levels, from the field workers who administer censuses and household surveys to the committees and working parties of the national and international statistical agencies that develop the nomenclature, classifications, and standards fundamental to an international statistical system. Nongovernmental organizations and the private sector have also made important contributions, both in gathering primary data and in organizing and publishing their results. And academic researchers have played a crucial role in developing statistical methods and carrying on a continuing dialogue about the quality and interpretation of statistical indicators. All these contributors have a strong belief that available, accurate data will improve the quality of public and private decisionmaking.

The organizations listed here have made *World Development Indicators* possible by sharing their data and their expertise with us. More important, their collaboration contributes to the World Bank's efforts, and to those of many others, to improve the quality of life of the world's people. We acknowledge our debt and gratitude to all who have helped to build a base of comprehensive, quantitative information about the world and its people.

For easy reference, Web addresses are included for each listed organization. The addresses shown were active on March 1, 2010. Information about the World Bank is also provided.

International and government agencies

Carbon Dioxide Information Analysis Center

The Carbon Dioxide Information Analysis Center (CDIAC) is the primary global climate change data and information analysis center of the U.S. Department of Energy. The CDIAC's scope includes anything that would potentially be of value to those concerned with the greenhouse effect and global climate change, including concentrations of carbon dioxide and other radiatively active gases in the atmosphere, the role of the terrestrial biosphere and the oceans in the biogeochemical cycles of greenhouse gases, emissions of carbon dioxide to the atmosphere, long-term climate trends, the effects of elevated carbon dioxide on vegetation, and the vulnerability of coastal areas to rising sea levels.

For more information, see http://cdiac.esd.ornl.gov/.

Deutsche Gesellschaft für Technische Zusammenarbeit

The Deutsche Gesellschaft für Technische Zusammenarbeit (GTZ) GmbH is a German government-owned corporation for international cooperation with worldwide operations. GTZ's aim is to positively shape political, economic, ecological, and social development in partner countries, thereby improving people's living conditions and prospects.

For more information, see www.gtz.de/.

Food and Agriculture Organization

The Food and Agriculture Organization, a specialized agency of the United Nations, was founded in October 1945 with a mandate to raise nutrition levels and living standards, to increase agricultural productivity, and to better the condition of rural populations. The organization provides direct development assistance;

collects, analyzes, and disseminates information; offers policy and planning advice to governments; and serves as an international forum for debate on food and agricultural issues.

For more information, see www.fao.org/.

Internal Displacement Monitoring Centre

The Internal Displacement Monitoring Centre was established in 1998 by the Norwegian Refugee Council and is the leading international body monitoring conflict-induced internal displacement worldwide. The center contributes to improving national and international capacities to protect and assist the millions of people around the globe who have been displaced within their own country as a result of conflicts or human rights

For more information, see www.internal-displacement.org/.

International Civil Aviation Organization

The International Civil Aviation Organization (ICAO), a specialized agency of the United Nations, is responsible for establishing international standards and recommended practices and procedures for the technical, economic, and legal aspects of international civil aviation operations. ICAO's strategic objectives include enhancing global aviation safety and security and the efficiency of aviation operations, minimizing the adverse effect of global civil aviation on the environment, maintaining the continuity of aviation operations, and strengthening laws governing international civil aviation.

For more information, see www.icao.int/.

International Labour Organization

The International Labour Organization (ILO), a specialized agency of the United Nations, seeks the promotion of social justice and internationally recognized human and labor rights. ILO helps advance the creation of decent jobs and the kinds of economic and working conditions that give working people and business people a stake in lasting peace, prosperity, and progress. As part of its mandate, the ILO maintains an extensive statistical publication program.

For more information, see www.ilo.org/.

International Monetary Fund

The International Monetary Fund (IMF) is an international organization of 186 member countries established to promote international monetary cooperation, a stable system of exchange rates, and the balanced expansion of international trade and to foster economic growth and high levels of employment. The IMF reviews national, regional, and global economic and financial developments; provides policy advice to member countries; and serves as a forum where they can discuss the national, regional, and global consequences of their policies.

The IMF also makes financing temporarily available to member countries to help them address balance of payments problems. Among the IMF's core missions are the collection and dissemination of high-quality macroeconomic and financial statistics as an essential prerequisite for formulating appropriate policies. The

PARTNERS

IMF provides technical assistance and training to member countries in areas of its core expertise, including the development of economic and financial data in accordance with international standards.

For more information, see www.imf.org/.

International Telecommunication Union

The International Telecommunication Union (ITU) is the leading UN agency for information and communication technologies. ITU's mission is to enable the growth and sustained development of telecommunications and information networks and to facilitate universal access so that people everywhere can participate in, and benefit from, the emerging information society and global economy. A key priority lies in bridging the so-called Digital Divide by building information and communication infrastructure, promoting adequate capacity building, and developing confidence in the use of cyberspace through enhanced online security. ITU also concentrates on strengthening emergency communications for disaster prevention and mitigation.

For more information, see www.itu.int/.

KPMG

KPMG operates as an international network of member firms in more than 140 countries offering audit, tax, and advisory services. It works closely with clients, helping them to mitigate risks and perform in the dynamic and challenging environment in which they do business.

For more information, see www.kpmg.com/Global.

National Science Foundation

The National Science Foundation (NSF) is an independent U.S. government agency whose mission is to promote the progress of science; to advance the national health, prosperity, and welfare; and to secure the national defense. NSF's goals—discovery, learning, research infrastructure, and stewardship—provide an integrated strategy to advance the frontiers of knowledge, cultivate a world-class, broadly inclusive science and engineering workforce, expand the scientific literacy of all citizens, build the nation's research capability through investments in advanced instrumentation and facilities, and support excellence in science and engineering research and education through a capable and responsive organization.

For more information, see www.nsf.gov/.

Organisation for Economic Co-operation and Development

The Organisation for Economic Co-operation and Development (OECD) includes 30 member countries sharing a commitment to democratic government and the market economy to support sustainable economic growth, boost employment, raise living standards, maintain financial stability, assist other countries' economic development, and contribute to growth in world trade. With active relationships with some 100 other countries, it has a global reach. It is best known for its publications and statistics, which cover economic and social issues from macroeconomics to trade, education, development, and science and innovation.

The Development Assistance Committee (DAC, www.oecd.org/dac/) is one of the principal bodies through which the OECD deals with issues related to cooperation with developing countries. The DAC is a key forum

of major bilateral donors, who work together to increase the effectiveness of their common efforts to support sustainable development. The DAC concentrates on two key areas: the contribution of international development to the capacity of developing countries to participate in the global economy and the capacity of people to overcome poverty and participate fully in their societies.

For more information, see www.oecd.org/.

Stockholm International Peace Research Institute

The Stockholm International Peace Research Institute (SIPRI) conducts research on questions of conflict and cooperation of importance for international peace and security, with the aim of contributing to an understanding of the conditions for peaceful solutions to international conflicts and for a stable peace. SIPRI's main publication, *SIPRI Yearbook*, is an authoritive and independent source on armaments and arms control and other conflict and security issues.

For more information, see www.sipri.org/.

Understanding Children's Work

As part of broader efforts to develop effective and long-term solutions to child labor, the International Labour Organization, the United Nations Children's Fund (UNICEF), and the World Bank initiated the joint interagency research program "Understanding Children's Work and Its Impact" in December 2000. The Understanding Children's Work (UCW) project was located at UNICEF's Innocenti Research Centre in Florence, Italy, until June 2004, when it moved to the Centre for International Studies on Economic Growth in Rome.

The UCW project addresses the crucial need for more and better data on child labor. UCW's online database contains data by country on child labor and the status of children.

For more information, see www.ucw-project.org/.

United Nations

The United Nations currently has 192 member states. The purposes of the United Nations, as set forth in its charter, are to maintain international peace and security; to develop friendly relations among nations; to cooperate in solving international economic, social, cultural, and humanitarian problems and in promoting respect for human rights and fundamental freedoms; and to be a center for harmonizing the actions of nations in attaining these ends.

For more information, see www.un.org/.

United Nations Centre for Human Settlements, Global Urban Observatory

The Urban Indicators Programme of the United Nations Human Settlements Programme was established to address the urgent global need to improve the urban knowledge base by helping countries and cities design, collect, and apply policy-oriented indicators related to development at the city level.

With the Urban Indicators and Best Practices programs, the Global Urban Observatory is establishing a worldwide information, assessment, and capacity-building network to help governments, local authorities, the private sector, and nongovernmental and other civil society organizations.

For more information, see www.unhabitat.org/.

PARTNERS

United Nations Children's Fund

The United Nations Children's Fund (UNICEF) works with other UN bodies and with governments and non-governmental organizations to improve children's lives in more than 190 countries through various programs in education and health. UNICEF focuses primarily on five areas: child survival and development, basic education and gender equality (including girls' education), child protection, HIV/AIDS, and policy advocacy and partnerships.

For more information, see www.unicef.org/.

United Nations Conference on Trade and Development

The United Nations Conference on Trade and Development (UNCTAD) is the principal organ of the United Nations General Assembly in the field of trade and development. Its mandate is to accelerate economic growth and development, particularly in developing countries. UNCTAD discharges its mandate through policy analysis; intergovernmental deliberations, consensus building, and negotiation; monitoring, implementation, and follow-up; and technical cooperation.

For more information, see www.unctad.org/.

United Nations Department of Peacekeeping Operations

The United Nations Department of Peacekeeping Operations contributes to the most important function of the United Nations—maintaining international peace and security. The department helps countries torn by conflict to create the conditions for lasting peace. The first peacekeeping mission was established in 1948 and has evolved to meet the demands of different conflicts and a changing political landscape. Today's peacekeepers undertake a wide variety of complex tasks, from helping build sustainable institutions of governance, to monitoring human rights, to assisting in security sector reform, to disarmaming, demobilizing, and reintegrating former combatants.

For more information, see www.un.org/en/peacekeeping/.

United Nations Educational, Scientific, and Cultural Organization, Institute for Statistics

The United Nations Educational, Scientific, and Cultural Organization (UNESCO) is a specialized agency of the United Nations that promotes international cooperation among member states and associate members in education, science, culture, and communications. The UNESCO Institute for Statistics is the organization's statistical branch, established in July 1999 to meet the growing needs of UNESCO member states and the international community for a wider range of policy-relevant, timely, and reliable statistics on these topics.

For more information, see www.uis.unesco.org/.

United Nations Environment Programme

The mandate of the United Nations Environment Programme is to provide leadership and encourage partnership in caring for the environment by inspiring, informing, and enabling nations and people to improve their quality of life without compromising that of future generations.

For more information, see www.unep.org/.

United Nations Industrial Development Organization

The United Nations Industrial Development Organization was established to act as the central coordinating body for industrial activities and to promote industrial development and cooperation at the global, regional, national, and sectoral levels. Its mandate is to help develop scientific and technological plans and programs for industrialization in the public, cooperative, and private sectors.

For more information, see www.unido.org/.

United Nations Office on Drugs and Crime

The United Nations Office on Drugs and Crime was established in 1977 and is a global leader in the fight against illicit drugs and international crime. The office assists member states in their struggle against illicit drugs, crime, and terrorism by helping build capacity, conducting research and analytical work, and assisting in the ratification and implementation of relevant international treaties and domestic legislation related to drugs, crime, and terrorism.

For more information, see www.unodc.org/.

The UN Refugee Agency

The UN Refugee Agency (UNHCR) is mandated to lead and coordinate international action to protect refugees and resolve refugee problems worldwide. Its primary purpose is to safeguard the rights and well-being of refugees. UNHCR also collects and disseminates statistics on refugees.

For more information, see www.unhcr.org

Upsalla Conflict Data Program

The Upsalla Conflict Data Program has collected information on armed violence since 1946 and is one of the most accurate and well used data sources on global armed conflicts. Its definition of armed conflict is becoming a standard in how conflicts are systematically defined and studied. In addition to data collection on armed violence, its researchers conduct theoretically and empirically based analyses of the causes, escalation, spread, prevention, and resolution of armed conflict.

For more information, see www.pcr.uu.se/research/UCDP/.

World Bank

The World Bank is a vital source of financial and technical assistance for developing countries. The World Bank is made up of two unique development institutions owned by 186 member countries—the International Bank for Reconstruction and Development (IBRD) and the International Development Association (IDA). These institutions play different but collaborative roles to advance the vision of an inclusive and sustainable globalization. The IBRD focuses on middle-income and creditworthy poor countries, while IDA focuses on the poorest countries. Together they provide low-interest loans, interest-free credits, and grants to developing countries for a wide array of purposes, including investments in education, health, public administration, infrastructure, financial and private sector development, agriculture, and environmental and natural resource management. The World Bank's work focuses on achieving the Millennium Development Goals by working with partners to alleviate poverty.

For more information, see www.worldbank.org/data/.

PARTNERS

World Health Organization

The objective of the World Health Organization (WHO), a specialized agency of the United Nations, is the attainment by all people of the highest possible level of health. It is responsible for providing leadership on global health matters, shaping the health research agenda, setting norms and standards, articulating evidence-based policy options, providing technical support to countries, and monitoring and assessing health trends.

For more information, see www.who.int/.

World Intellectual Property Organization

The World Intellectual Property Organization (WIPO) is a specialized agency of the United Nations dedicated to developing a balanced and accessible international intellectual property (IP) system, which rewards creativity, stimulates innovation, and contributes to economic development while safeguarding the public interest. WIPO carries out a wide variety of tasks related to the protection of IP rights. These include developing international IP laws and standards, delivering global IP protection services, encouraging the use of IP for economic development, promoting better understanding of IP, and providing a forum for debate.

For more information, see www.wipo.int/.

World Tourism Organization

The World Tourism Organization is an intergovernmental body entrusted by the United Nations with promoting and developing tourism. It serves as a global forum for tourism policy issues and a source of tourism know-how.

For more information, see www.unwto.org/.

World Trade Organization

The World Trade Organization (WTO) is the only international organization dealing with the global rules of trade between nations. Its main function is to ensure that trade flows as smoothly, predictably, and freely as possible. It does this by administering trade agreements, acting as a forum for trade negotiations, settling trade disputes, reviewing national trade policies, assisting developing countries in trade policy issues—through technical assistance and training programs—and cooperating with other international organizations. At the heart of the system—known as the multilateral trading system—are the WTO's agreements, negotiated and signed by a large majority of the world's trading nations and ratified by their parliaments.

For more information, see www.wto.org/.

Private and nongovernmental organizations

Containerisation International

Containerisation International Yearbook is one of the most authoritative reference books on the container industry. The information can be accessed on the Containerisation International Web site, which also provides a comprehensive online daily business news and information service for the container industry.

For more information, see www.ci-online.co.uk/.

DHL

DHL provides shipping and customized transportation solutions for customers in more than 220 countries and territories. It offers expertise in express, air, and ocean freight; overland transport; contract logistics solutions; and international mail services.

For more information, see www.dhl.com/.

International Institute for Strategic Studies

The International Institute for Strategic Studies (IISS) provides information and analysis on strategic trends and facilitates contacts between government leaders, business people, and analysts that could lead to better public policy in international security and international relations. The IISS is a primary source of accurate, objective information on international strategic issues.

For more information, see www.iiss.org/.

International Road Federation

The International Road Federation (IRF) is a nongovernmental, not-for-profit organization whose mission is to encourage and promote development and maintenance of better, safer, and more sustainable roads and road networks. Working together with its members and associates, the IRF promotes social and economic benefits that flow from well planned and environmentally sound road transport networks. It helps put in place technological solutions and management practices that provide maximum economic and social returns from national road investments. The IRF works in all aspects of road policy and development worldwide with governments and financial institutions, members, and the community of road professionals.

For more information, see www.irfnet.org/.

Netcraft

Netcraft provides Internet security services such as antifraud and antiphishing services, application testing, code reviews, and automated penetration testing. Netcraft also provides research data and analysis on many aspects of the Internet and is a respected authority on the market share of web servers, operating systems, hosting providers, Internet service providers, encrypted transactions, electronic commerce, scripting languages, and content technologies on the Internet.

For more information, see http://news.netcraft.com/.

PARTNERS

PricewaterhouseCoopers

PricewaterhouseCoopers provides industry-focused services in the fields of assurance, tax, human resources, transactions, performance improvement, and crisis management services to help address client and stakeholder issues.

Standard & Poor's

Standard & Poor's is the world's foremost provider of independent credit ratings, indexes, risk evaluation, investment research, and data. S&P's *Global Stock Markets Factbook* draws on data from S&P's Emerging Markets Database (EMDB) and other sources covering data on more than 100 markets with comprehensive market profiles for 82 countries. Drawing a sample of stocks in each EMDB market, Standard & Poor's calculates indexes to serve as benchmarks that are consistent across national boundaries.

For more information, see www.standardandpoors.com/.

World Conservation Monitoring Centre

The World Conservation Monitoring Centre provides information on the conservation and sustainable use of the world's living resources and helps others to develop information systems of their own. It works in close collaboration with a wide range of people and organizations to increase access to the information needed for wise management of the world's living resources.

World Economic Forum

The World Economic Forum (WEF) is an independent international organization committed to improving the state of the world by engaging leaders in partnerships to shape global, regional, and industry agendas. Economic research at the WEF—led by the Global Competitiveness Programme—focuses on identifying the impediments to growth so that strategies to achieve sustainable economic progress, reduce poverty, and increase prosperity can be developed. The WEF's competitiveness reports range from global coverage, such as Global Competitiveness Report, to regional and topical coverage, such as Africa Competitiveness Report, The Lisbon Review, and Global Information Technology Report.

For more information, see: www.weforum.org/.

World Information Technology and Services Alliance

The World Information Technology and Services Alliance (WITSA) is a consortium of more than 60 information technology (IT) industry associations from economies around the world. WITSA members represent over 90 percent of the world IT market. As the global voice of the IT industry, WITSA has an active role in international public policy issues affecting the creation of a robust global information infrastructure, including advocating policies that advance the industry's growth and development, facilitating international trade and investment in IT products and services, increasing competition through open markets and regulatory reform, strengthening national industry associations through the sharing of knowledge, protecting intellectual property, encouraging cross-industry and government cooperation to enhance information security,

bridging the education and skills gap, and safeguarding the viability and continued growth of the Internet and electronic commerce.

For more information, see www.witsa.org/.

World Resources Institute

The World Resources Institute is an independent center for policy research and technical assistance on global environmental and development issues. The institute provides—and helps other institutions provide—objective information and practical proposals for policy and institutional change that will foster environmentally sound, socially equitable development. The institute's current areas of work include trade, forests, energy, economics, technology, biodiversity, human health, climate change, sustainable agriculture, resource and environmental information, and national strategies for environmental and resource management.

For more information, see www.wri.org/.

USERS GUIDE

Tables

The tables are numbered by section and display the identifying icon of the section. Countries and economies are listed alphabetically (except for Hong Kong SAR, China, which appears after China). Data are shown for 155 economies with populations of more than 1 million, as well as for Taiwan, China, in selected tables. Table 1.6 presents selected indicators for 55 other economies—small economies with populations between 30,000 and 1 million and smaller economies if they are members of the International Bank for Reconstruction and Development or, as it is commonly known, the World Bank. A complete set of indicators for these economies is available on the World Development Indicators CD-ROM and in WDI Online. The term country, used interchangeably with economy, does not imply political independence, but refers to any territory for which authorities report separate social or economic statistics. When available, aggregate measures for income and regional groups appear at the end of each table.

Indicators are shown for the most recent year or period for which data are available and, in most tables, for an earlier year or period (usually 1990 or 1995 in this edition). Time-series data for all 210 economies are available on the *World Development Indicators* CD-ROM and in *WDI Online*.

Known deviations from standard definitions or breaks in comparability over time or across countries are either footnoted in the tables or noted in *About the data*. When available data are deemed to be too weak to provide reliable measures of levels and trends or do not adequately adhere to international standards, the data are not shown.

Aggregate measures for income groups

The aggregate measures for income groups include 210 economies (the economies listed in the main tables plus those in table 1.6) whenever data are available. To maintain consistency in the aggregate measures over time and between tables, missing data are imputed where possible. The aggregates are totals (designated by a t if the aggregates include gap-filled estimates for missing data and by an t, for

simple totals, where they do not), median values (*m*), weighted averages (*w*), or simple (unweighted) averages (*u*). Gap filling of amounts not allocated to countries may result in discrepancies between subgroup aggregates and overall totals. For further discussion of aggregation methods, see *Statistical methods*.

Aggregate measures for regions

The aggregate measures for regions cover only low- and middle-income economies, including economies with populations of less than 1 million listed in table 1.6.

The country composition of regions is based on the World Bank's analytical regions and may differ from common geographic usage. For regional classifications, see the map on the inside back cover and the list on the back cover flap. For further discussion of aggregation methods, see Statistical methods.

Statistics

Data are shown for economies as they were constituted in 2008, and historical data are revised to reflect current political arrangements. Exceptions are noted throughout the tables.

Additional information about the data is provided in *Primary data documentation*. That section summarizes national and international efforts to improve basic data collection and gives country-level information on primary sources, census years, fiscal years, statistical methods and concepts used, and other background information. *Statistical methods* provides technical information on some of the general calculations and formulas used throughout the book.

Data consistency, reliability, and comparability

Considerable effort has been made to standardize the data, but full comparability cannot be assured, and care must be taken in interpreting the indicators. Many factors affect data availability, comparability, and reliability: statistical systems in many developing economies are still weak; statistical methods, coverage, practices, and definitions differ widely; and cross-country and intertemporal comparisons involve complex technical and conceptual problems that cannot be resolved unequivocally. Data coverage may

not be complete because of special circumstances affecting the collection and reporting of data, such as problems stemming from conflicts.

For these reasons, although data are drawn from the sources thought to be most authoritative, they should be construed only as indicating trends and characterizing major differences among economies rather than as offering precise quantitative measures of those differences. Discrepancies in data presented in different editions of *World Development Indicators* reflect updates by countries as well as revisions to historical series and changes in methodology. Thus readers are advised not to compare data series between editions of *World Development Indicators* or between different World Bank publications. Consistent time-series data for 1960–2008 are available on the *World Development Indicators* CD-ROM and in *WDI Online*.

Except where otherwise noted, growth rates are in real terms. (See Statistical methods for information on the methods used to calculate growth rates.) Data for some economic indicators for some economies are presented in fiscal years rather than calendar years; see Primary data documentation. All dollar figures are current U.S. dollars unless otherwise stated. The methods used for converting national currencies are described in Statistical methods.

Country notes

- Unless otherwise noted, data for China do not include data for Hong Kong SAR, China; Macao SAR, China; or Taiwan, China.
- Data for Indonesia include Timor-Leste through 1999 unless otherwise noted
- Montenegro declared independence from Serbia and Montenegro on June 3, 2006. When available, data for each country are shown separately. However, some indicators for Serbia continue to include data for Montenegro through 2005; these data are footnoted in the tables. Moreover, data for most indicators from 1999 onward for Serbia exclude data for Kosovo, which in 1999 became a territory under international administration pursuant to UN Security Council Resolution 1244 (1999);

any exceptions are noted. Kosovo became a World Bank member on June 29, 2009, and its data are shown in the tables when available.

Classification of economies

For operational and analytical purposes the World Bank's main criterion for classifying economies is gross national income (GNI) per capita (calculated by the World Bank Atlas method). Every economy is classified as low income, middle income (subdivided into lower middle and upper middle), or high income. For income classifications see the map on the inside front cover and the list on the front cover flap. Low- and middle-income economies are sometimes referred to as developing economies. The term is used for convenience; it is not intended to imply that all economies in the group are experiencing similar development or that other economies have reached a preferred or final stage of development. Note that classification by income does not necessarily reflect development status. Because GNI per capita changes over time, the country composition of income groups may change from one edition of World Development Indicators to the next. Once the classification is fixed for an edition, based on GNI per capita in the most recent year for which data are available (2008 in this edition), all historical data presented are based on the same country grouping.

Low-income economies are those with a GNI per capita of \$975 or less in 2008. Middle-income economies are those with a GNI per capita of more than \$975 but less than \$11,906. Lower middle-income and upper middle-income economies are separated at a GNI per capita of \$3,855. High-income economies are those with a GNI per capita of \$11,906 or more. The 16 participating member countries of the euro area are presented as a subgroup under high-income economies.

Symbols

...

means that data are not available or that aggregates cannot be calculated because of missing data in the years shown.

0 or 0.0

means zero or small enough that the number would round to zero at the displayed number of decimal places.

/

in dates, as in 2003/04, means that the period of time, usually 12 months, straddles two calendar years and refers to a crop year, a survey year, or a fiscal year.

\$

means current U.S. dollars unless otherwise noted.

>

means more than.

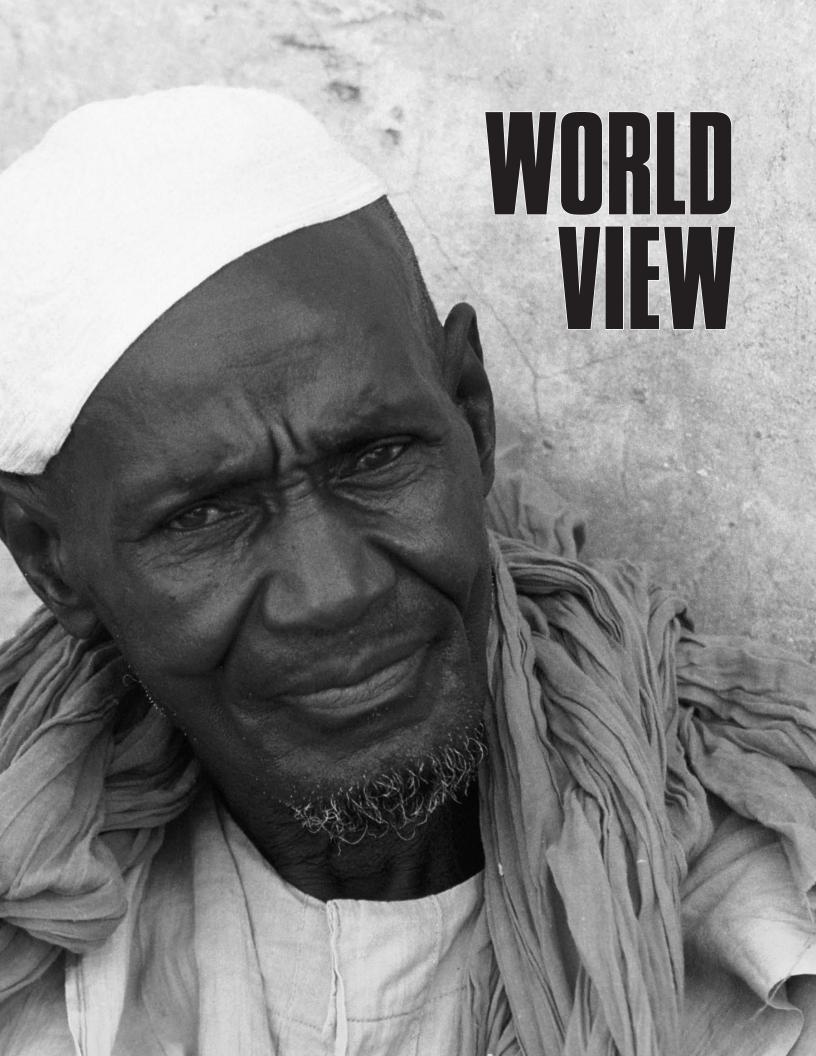

<

means less than.

Data presentation conventions

- A blank means not applicable or, for an aggregate, not analytically meaningful.
- A billion is 1,000 million.
- A trillion is 1,000 billion.
- Figures in italics refer to years or periods other than those specified or to growth rates calculated for less than the full period specified.
- Data for years that are more than three years from the range shown are footnoted.

The cutoff date for data is February 1, 2010.

Nations in September 2000, was not the first effort to mobilize global action to end poverty. The First United Nations Development Decade, proclaimed in 1961, drew attention to the great differences among development outcomes and called for accelerating growth. Subsequent Development Decades formulated new development strategies. But not until the 1990s did a consensus emerge that eliminating poverty, broadly defined, should be at the center of development efforts. Analytical work at the World Bank (World Bank 1990) and the United Nations Development Programme (UNDP 1990) shaped a view of poverty as multifaceted, not just about income or consumption, and envisioned development as a means to empower the poor by increasing their access to employment and to health, education, and other social services. This consensus was reflected in a series of UN summits in the early 1990s that culminated in the 1995 World Summit on Social Development, which endorsed the goal of eradicating poverty.

The Millennium Development Goals: countdown to 2015

Inspired by the lofty goals announced at these summits, a high-level meeting of the Development Assistance Committee in 1996 endorsed seven International Development Goals and accompanying indicators for assessing aid efforts (OECD DAC 1996). Despite the goals' origins in UN summits and conferences, some viewed them with suspicion because they had been promulgated by rich donors. Nevertheless, the goals helped focus attention on the need to measure development outcomes. And most were incorporated into the Millennium Declaration, which was adopted unanimously at the United Nations Millennium Summit in 2000. A year later the UN Secretary-General's Road Map towards the Implementation of the Millennium Declaration (UN 2001) formally unveiled eight goals, supported by 18 quantified and time-bound targets and 48 indicators, which became the Millennium Development Goals (MDGs).

Like the International Development Goals, the MDGs took 1990 as their benchmark and 2015 as the completion date. An important difference is the inclusion in the MDGs of an eighth goal defining a global partnership for development between rich countries and developing countries. The partnership is intended to achieve the seven other goals by creating a fair and rule-based financial and trading system,

increasing aid for the poorest and most isolated countries, and improving access to new technologies.

A decade has passed since the Millennium Declaration, and the countdown to 2015 has begun. World Development Indicators 2010 takes a comprehensive look at the issues facing developing countries as they attempt to meet the targets set for 2015. This section looks at progress through 2008 and examines such cross-cutting issues as inequality in outcomes; tension between quantitative targets and quality outcomes; impact of the quality of governance on implementation of the MDGs, particularly in fragile states; and progress in data availability and quality.

An overview of progress on the Millennium Development Goals

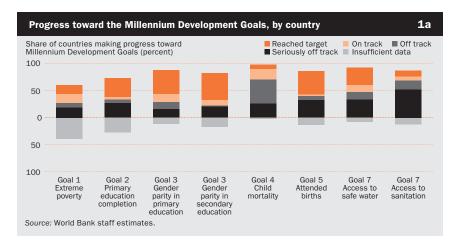

Opinion is divided on whether the MDGs were intended as global targets and whether each country was intended to adopt or adapt them. The Millennium Declaration enunciated global targets, but the UN Secretary-General's road map saw the targets as operational goals for member states. For countries already making strong development progress, the targets were relatively easy. Economic growth is closely associated with progress on the MDGs (see section 4). Where economic growth was rapid, poverty reduction and social indicators improved; where

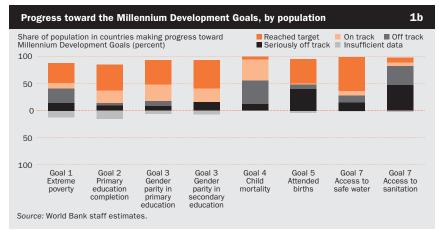

growth was slow and institutional deficits large, the going was more difficult. What worked in one setting did not always work in others. Responses to policy initiatives depend on constraints imposed by local culture, the resources at society's disposal, and the local environment.

Progress has been considerable. Despite the current crisis, the target to reduce by half the proportion of people living in extreme poverty is within reach at a global level. Rapid growth in East Asia and Pacific and falling poverty rates in South Asia, the two regions with the most people living on less than \$1.25 a day, account for this remarkable achievement.

But progress has been uneven at the country level (figure 1a). Only 49 of 87 countries with data are on track to achieve the poverty target. Some 47 percent of the people in low- and middle-income countries live in countries that have already attained the target or are on track to do so, while 41 percent live in countries that are off track or seriously off track (figure 1b). And 12 percent live in the 60 countries for which there are insufficient data to assess progress.

Progress on the human development indicators is mixed. In absolute terms progress has been impressive. Since 2000 some 37 million more children have been able to attend and complete primary school. More than 14 million children have been vaccinated against measles, with similar progress in other vaccination programs and health-related services. Since 2000 the number of children dying before age 5 has fallen from more than 10 million a year to 8.8 million.

The greatest progress has been toward the targets for primary school attendance, gender equality in primary and secondary school, and access to safe drinking water:

- Seven of ten people in developing countries live in countries that have already attained universal primary school completion or are on track to do so. But only two in five developing countries will have done so, while more than one in three countries is off track or seriously off track.
- Four of five people in developing countries live in countries that have attained or are likely to attain gender equality in primary and secondary education. Some 81 of 144 countries have attained this goal, and another 10 are on track to do so.
- Seven of ten people in developing countries live in countries that have halved the proportion of people without sustainable access to improved water, though more than half of developing countries have not achieved the target. Progress in sanitation has been much slower, among the worst for the MDGs. Only 16 percent of the population in developing countries live in countries that have managed to halve the proportion of people with sustainable access to basic sanitation, and only one in five countries has succeeded in doing so. Nearly 7 of 10 countries are off track or seriously off track on this goal.

Progress has been slowest in reducing child malnutrition and child mortality.

- Standards for measuring malnutrition (weight for age) among children have been revised. Under the new methodology 25 of the 55 countries with data have met or are on track to meet this goal, while 30 are not.
- Some 45 percent of people in developing countries live in countries that have reduced or are on track to reduce the under-five mortality rate by two-thirds, while some 56

percent live in the 102 of 144 countries that are unlikely to attain this goal.

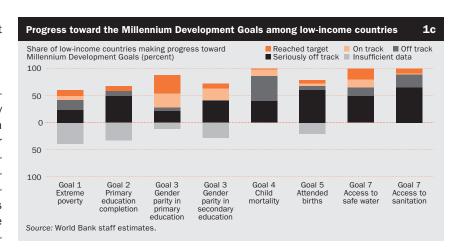

Progress by income group

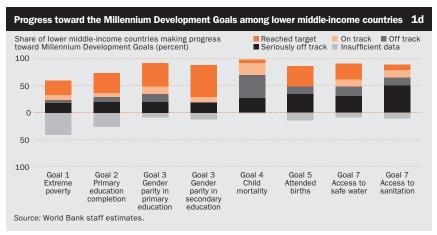

The first edition of *World Development Indicators* (in 1997) reported a developing country population in 1995 of 4.8 billion, two-thirds in low-income countries. China and India together had 2.1 billion people. This edition reports a developing country population in 2008 of 5.6 billion, two-thirds of whom live in lower middle-income countries. This massive shift reflects the advance of China and India from low-income to lower middle-income status. Today, 43 low-income countries account for just under 1 billion people, and 46 upper middle-income countries account for about 950 million. Some 3.7 billion people live in 55 lower middle-income countries, two-thirds of them in China and India.

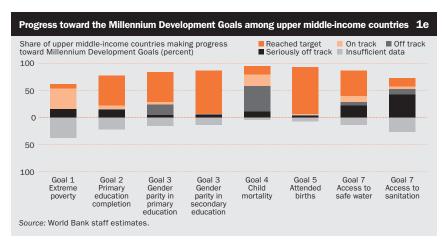

Progress on the MDGs among low-income countries has generally been poor (figure 1c). This is not surprising considering the domination of this group by states in fragile situations. With the exception of gender equality in primary schools (61 percent of low-income countries expect to ensure gender equality in primary schools but only 30 percent in secondary schools) and access to water (35 percent of countries expect to reach this goal), no more than one in five countries has reached or is on track to reach the goals.

Middle-income countries generally do much better (figure 1d). Progress for upper middle-income countries is more difficult when the goal involves a large reduction from already advanced levels attained (figure 1e). Thus, for example, child mortality rates in upper middle-income countries averaged 47 per 1,000 in 1990 (four times the average for high-income countries) and have fallen to 24 (compared with 7 for high-income countries). A two-thirds reduction would require the rate to fall to 16. Still, a majority of these countries are expected to attain most of the goals.

Lower middle-income countries also do much better than low-income countries, though they still face serious challenges in meeting human development-related goals. A third expect to reach the poverty reduction goal, and 38 percent have already attained the primary school completion goal and 7 percent are on track to do so. Two of three countries in this group have attained or expect to attain gender equality in secondary schools.

And 43 percent expect to attain access to the water goal. The two areas where lower middle-income countries do poorly are child mortality and access to sanitation, with 7 of 10 countries not expected to attain the child mortality reduction goal and 2 of 3 countries the sanitation goal. Many of these countries have large concentrations of poverty reflecting high levels of income inequality.

Goal 1 Eradicate poverty and hunger

We will spare no effort to free our fellow men, women and children from the abject and dehumanizing conditions of extreme poverty . . . We resolve further to halve, by the year 2015, the proportion of the world's people whose income is less than one dollar a day.

—United Nations Millennium Declaration (2000)

Target 1A
Halve, between 1990 and
2015, the proportion of
people whose income is
less than \$1.25 a day

Defined as average daily consumption of \$1.25 or less, extreme poverty means living on the edge of subsistence. The number of people living in extreme poverty has been falling since 1990, slowly at first and more rapidly since the turn of the century. The largest reduction has occurred in East Asia and Pacific, where China has made great strides. In South Asia accelerated growth in India could lift millions more out of poverty. Sub-Saharan Africa, which stagnated through most of the 1990s, has begun to reduce the number of people in extreme poverty. Although the decline was slowed by the global financial crisis, the number of people living in extreme poverty is expected to fall to around 900 million by 2015, even as the population living in developing countries rises to 5.8 billion. Still, an additional 1.1 billion people will live on less than \$2 a day.

Most regions on track

The international poverty line was revalued from \$1.08 a day (in 1993 prices) to \$1.25 (in 2005 prices), using new estimates of the cost of living derived from the 2005 International Comparison Program. Although the new estimates increased the number and proportion of people living in extreme poverty, the reduction in poverty rates remained the same. East Asia and Pacific will exceed the target set by the Millennium Declaration, reducing extreme poverty rates

almost 90 percent from 1990 to 2015. South Asia, which made slower progress through the early part of the 21st century, will also reach the target if growth continues, as will the Middle East and North Africa and Latin America and the Caribbean. Sub-Saharan Africa will be the only region with a sizable number of people in extreme poverty that fails to reach the target.

Uneven progress

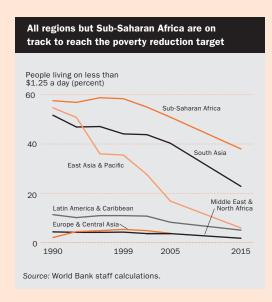

Global and regional averages disguise large differences among countries. Since 2000, 49 countries have attained the rate of poverty reduction needed to cut 1990 poverty rates by half and achieve the target. Thirty-eight remain off track and unlikely to reach the target. And 57 countries—22 of them in Sub-Saharan Africa—lack sufficient survey data to measure progress since 1990.

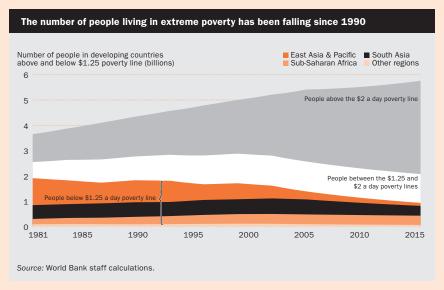

Living below the poverty line

Poverty lines in poor countries are usually set at the level needed to obtain a basic supply of food and the bare necessities of life. Many poor people subsist on far less than that. The average daily expenditure of the poor is derived from the poverty gap ratio—the average shortfall of the total population from the poverty line as a percentage of the poverty line. But averages are only that: many more live on even less. To overcome extreme poverty, everyone must first get to the poverty line.

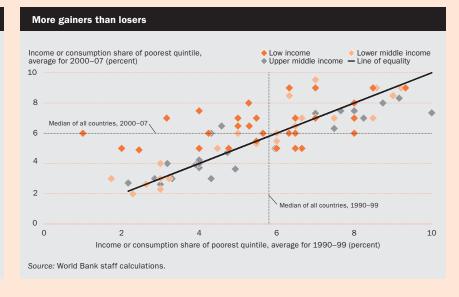

Monitoring inequality

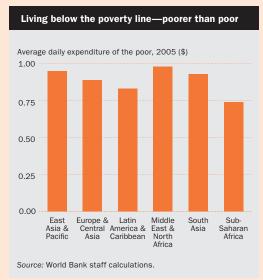

The share of income or consumption received by the poorest 20 percent of the population was incorporated in the Millennium Development Goals as a basic measure of equity. In a typical developing country the poorest 20 percent of the population accounts for just 6 percent of total income or consumption. Since 1990 that share has increased most in low-income countries and has tended to shrink in upper middle-income countries. Many factors affect the distribution of income or consumption, and there is no clear link between economic growth and changes in income distribution.

2010 World Development Indicators

Goal 1 Eradicate poverty and hunger

We strongly support fair globalization and resolve to make the goals of full and productive employment and decent work for all, including for women and young people... part of our efforts to achieve the Millennium Development Goals.

—United Nations World Summit Outcome (2005)

Target 1B
Achieve full and productive employment and decent work for all, including women and young people

Recognizing the importance of productive employment for creating the means for poverty reduction, the UN General Assembly adopted a new target at its 2005 high-level review of the Millennium Development Goals. Because employment patterns change as economies develop, the target does not specify values to be achieved. But time trends and differences between regions provide evidence of structural change—and progress toward the Millennium Development Goals.

Full employment

Labor time lost can never be recovered, so maintaining full employment is important for sustaining growth and income generation. But over the long run employment to population ratios tend to fall as economies become wealthier, young people stay in school longer, and people live longer past their working years.

Raising productivity

Increasing productivity is the key to raising incomes and reducing poverty. Over the past two decades output per worker has grown faster in Asia and Eastern Europe than in high-income economies. East Asia and Pacific, starting from a low level, has made the largest gains but has still not caught up with the middle-income economies of Europe and Central Asia, Latin America and the Caribbean, and the Middle East and North Africa. Average productivity in Sub-Saharan Africa remains

very low, roughly at the level in East Asia and Pacific in 1999.

Workers at risk

Vulnerable employment—own-account and unpaid family workers, who are least likely to be protected by labor laws and social safety nets—accounted for just over half of world employment in 2007 and remains high in East Asia and Pacific, South Asia, and Sub-Saharan Africa. Women are more likely than men to be in vulnerable employment.

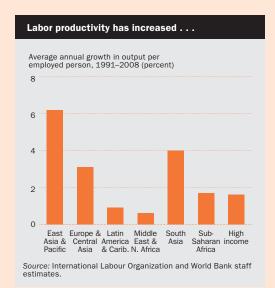

Target 1C
Halve, between 1990
and 2015, the proportion
of people who suffer
from hunger

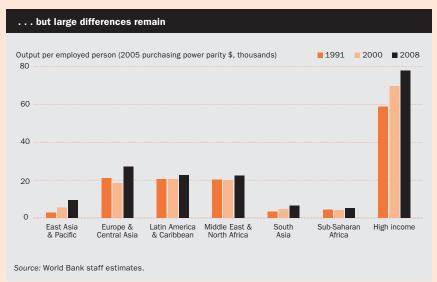

A calorie shortfall

Undernourishment measures the availability of food to meet people's basic energy needs. Rising agricultural production has kept ahead of population growth in most regions, but rising prices and the diversion of food crops to fuel production have reversed the declining rate of undernourishment since 2004–06. The Food and Agriculture Organization of the United Nations estimates that the number of people worldwide who receive less than 2,100 calories a day rose from 873 million in 2004–06 to 915 million in 2006–08 and could rise further in the next two years (FAO 2009b).

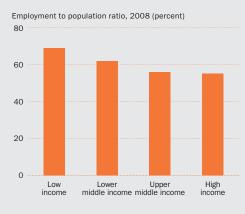

Underweight children

A shortfall in food calories is only one cause of malnutrition. The distribution of food within families, a person's health, and the availability of micronutrients (minerals and vitamins) also affect nutritional outcomes. Women and children are the most vulnerable. Even before the recent food crisis, about a quarter of children in Sub-Saharan Africa and two-fifths in South Asia were underweight. And children in the poorest households in developing countries are more than twice as likely to be underweight as those in the richest households.

Employment ratios tend to fall as income increases

 $\ensuremath{\textit{Source}}$ International Labour Organization, Key Indicators of the Labour Market database.

Workers in vulnerable employment lack safety nets

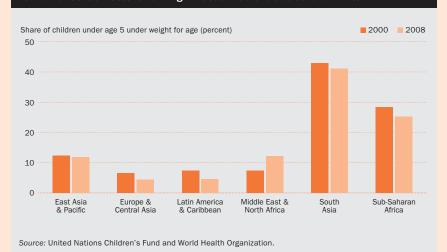

Source: International Labour Organization, Key Indicators of the Labour Market database.

People with insufficient daily nourishment

Child malnutrition rates remain high in South Asia and Sub-Saharan Africa

Goal 2 Achieve universal primary education

Every person—child, youth and adult—shall be able to benefit from educational opportunities designed to meet their basic learning needs.

—World Declaration on Education for All, Jomtien, Thailand (1990)

Target 2C
Ensure that by 2015 children
everywhere, boys and girls
alike, will be able to complete a
full course of primary schooling

The goal of educating every child at least through primary school was announced in 1990 by the Jomtien Conference on Education for All. Progress in the least developed countries, slow through the 1990s, has accelerated since 2000. Countries in three regions—East Asia and Pacific, Europe and Central Asia, and Latin America and the Caribbean—are close to enrolling all their primary-school-age children. The sharp increase in enrollment rates in Sub-Saharan Africa despite population growth is also encouraging. But as of 2006 an estimated 72 million children worldwide were not in school—and about half of them will have no contact with formal education. Within countries, poor children are less likely to be enrolled in school, but large proportions of children in wealthier households in the poorest developing countries are also not enrolled.

Keeping children in school

For all children to complete a course of primary education, they must be enrolled in school. Although enrollments in grade 1 have been increasing, many children drop out of primary school because their families do not see the

value of education. Many things discourage children and their parents: absent or indifferent teachers, inadequate or dangerous facilities, and demand for children's labor at home or in the market. Enrolling all children and keeping them in school will require continuing reforms and increased investment.

Progress toward education for all

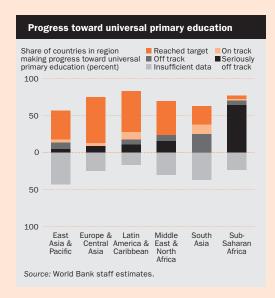

Based on available data, 50 developing countries have achieved universal primary education, and 7 more are on track to do so. Countries in Europe and Central Asia and Latin America and the Caribbean have been most successful in reaching the target. Thirty-eight countries, most of them in Sub-Saharan Africa, are seriously off track and unlikely to reach the target.

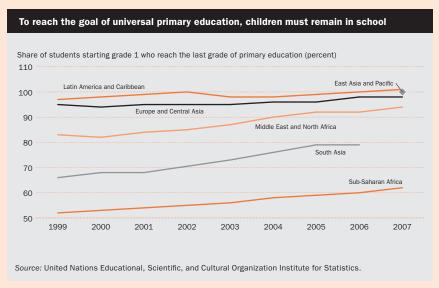

The literacy challenge

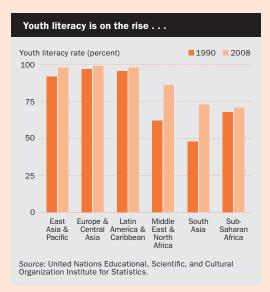

Literacy comes closest to a general measure of the quality of education outcomes. Throughout developing countries youth literacy rates are higher than adult literacy rates—a result of expanded access to formal schooling.

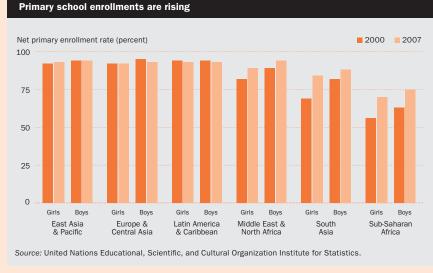

The United Nations Educational, Scientific, and Cultural Organization Institute of Statistics defines literacy as the ability to read and write with understanding a short, simple sentence about everyday life. In many countries national assessment tests are enabling ministries of education to monitor progress. But practices differ, and in some places literacy is assessed simply by school attendance.

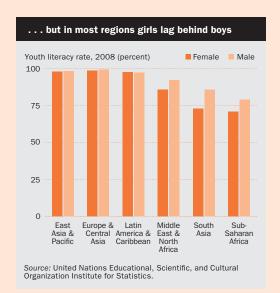

Dramatic improvements have occurred in the Middle East and North Africa and South Asia. But in every region except Latin America and the Caribbean boys are more literate than girls, a difference seen most starkly in South Asia and Sub-Saharan Africa.

2010 World Development Indicators

Goal 3 Promote gender equality and empower women

We also resolve . . . to promote gender equality and the empowerment of women as effective ways to combat poverty, hunger and disease and to stimulate development that is truly sustainable.

—United Nations Millennium Declaration (2000)

Target 3A
Eliminate gender disparity
in primary and secondary
education, preferably by
2005, and in all levels of
education no later than 2015

Education opportunities for girls have expanded. Patterns of enrollment in upper middle-income countries now resemble those in high-income countries, while those in lower middle-income countries are nearing equity. But gender gaps remain large in low-income countries, especially at the primary and secondary levels. Girls born in poor households and living in rural communities are least likely to be enrolled in school. Cultural attitudes and practices that promote early marriage, the seclusion of girls, and the education of boys over girls continue to present formidable barriers to gender parity.

Progress toward gender parity in education

Developing countries continue to make progress toward gender parity in primary and secondary education. Sixty-four countries, many of them in Europe and Central Asia and Latin America and the Caribbean, have achieved gender parity in enrollment, and another twenty are on track to do so by 2015. But 22 countries are seriously off track, the majority of them in Sub-Saharan Africa.

Patterns of progress at the secondary level are similar to those at the primary level: 73 countries have achieved gender parity, and another 14 are on track. Latin America and the Caribbean and Europe and Central Asia have made the most progress. However, 29 countries, more than two-thirds of them in Sub-Saharan Africa, are seriously off track and are unlikely to achieve parity if current trends continue. In most regions, progress toward gender parity

has been faster in secondary schools than in primary schools. In Latin America and the Caribbean, for example, four of five countries have reached the target at the secondary level, while only slightly more than half have reached the target or are on track to do so at the primary level. These patterns imply that boys are leaving secondary school in disproportionate numbers—not a good solution to achieving gender parity.

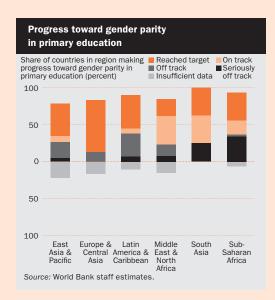

Data for tertiary education are not widely reported. Most countries with data have made progress toward gender parity, but countries in South Asia and Sub-Saharan Africa lag behind.

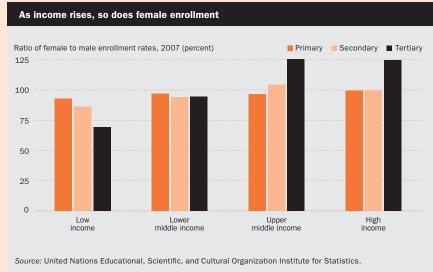

Where and how women work

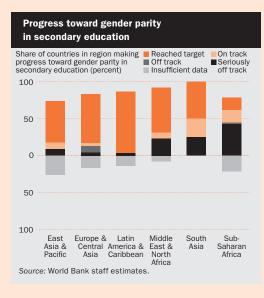

Women's share in paid employment in the nonagricultural sector has risen marginally in some regions but remains less than 20 percent in South Asia and Sub-Saharan Africa. There are more men than women in wage and salaried employment in all regions but Europe and Central Asia and Latin America and the Caribbean. In Sub-Saharan Africa there are almost twice as many men as women in salaried and wage employment. Women are also clearly segregated in sectors that are generally known to be lower paid. And in the sectors where women dominate, such as health care, women rarely hold upper-level management jobs.

Women in government

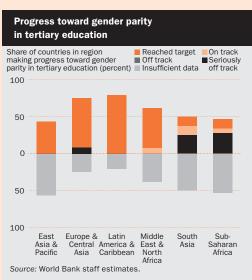

The proportion of parliamentary seats held by women has increased steadily since the 1990s. The most impressive gains have come in Latin America and the Caribbean, the Middle East and North Africa, and South Asia, where women's representation rose 30-50 percent over 1990-2009. But while countries in the Middle East and North Africa made substantial gains, women still hold less than 10 percent of parliamentary seats, the lowest among all regions. Latin America and the Caribbean is out in front, with women holding 23 percent of the seats. But Rwanda leads the way, making history in 2008 when it elected 56 percent of women to its parliament. Worldwide, women are entering more political leadership positions. In March 2009, 15 women were heads of state, up from 9 in 2000.

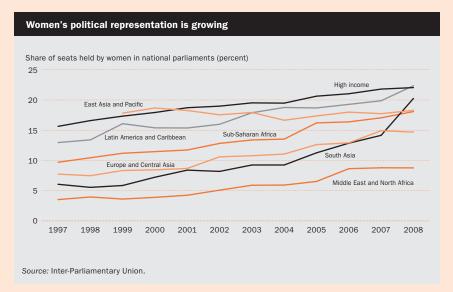

Goal 4 Reduce child mortality

As leaders we have a duty therefore to all the world's people, especially the most vulnerable and, in particular, the children of the world, to whom the future belongs.

—United Nations Millennium Declaration (2000)

Target 4A
Reduce by two-thirds,
between 1990 and 2015, the
under-five mortality rate

Deaths of children under age 5 have been declining since 1990. In 2006, for the first time, the number of children who died before their fifth birthday fell below 10 million. In developing countries child mortality declined about 25 percent, from 101 per 1,000 in 1990 to 73 in 2008. Still, many countries in Sub-Saharan Africa have made little progress—there, one child in seven dies before the fifth birthday. The odds are slightly better in South Asia, where one child in thirteen dies before the fifth birthday. These two regions remain overriding priorities for child survival interventions such as immunizations, exclusive breastfeeding, and insecticide-treated nets.

Measuring progress

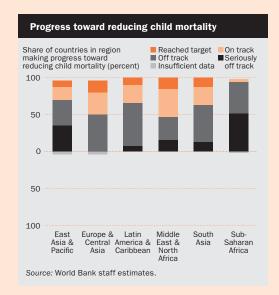

Thirty-nine countries have achieved or are now on track to achieve the target of a two-thirds reduction in under-five mortality rates. Two of the poorest countries in Sub-Saharan Africa, Eritrea and Malawi, have made remarkable progress. Successful countries now account for half the population of low- and middle-income economies.

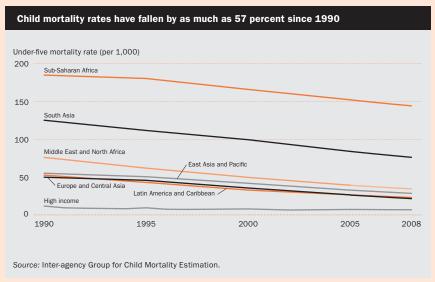

Preventing child deaths

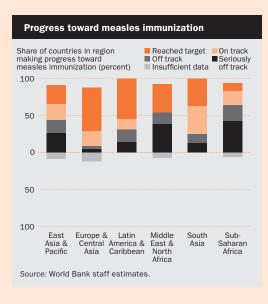

Immunizations for measles continue to expand worldwide. In all regions coverage is now more than 70 percent, resulting in marked improvements in child survival. However, severe disparities remain within countries. Only 40 percent of poor children are immunized, compared with more than 60 percent of children from wealthier households. In some countries, however, the poor have shared in these health improvements. In Mozambique immunization coverage increased from 58 percent in 1997 to 77 percent in 2003. The poorest 40 percent of households were the beneficiaries of most of this increase. Despite all these improvements, measles remains one of the leading causes of vaccine-preventable child mortality.

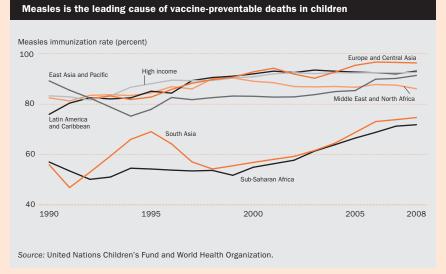

Life expectancy begins at birth

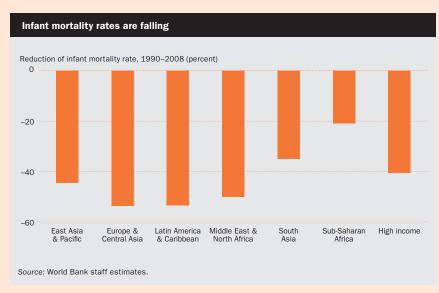

Infant mortality—child deaths before age 1—is the primary contributor to child mortality. Improvements in infant and child mortality are the major contributors to increasing life expectancy in developing countries. Success in reducing infant mortality may be viewed as a general indicator of progress toward the human development outcomes in the Millennium Development Goals: access to medicines, health facilities, water, and sanitation; fertility patterns; maternal health; maternal and infant nutrition; maternal and infant disease exposure; and female literacy (Mishra and Newhouse 2007).

Goal 5 Improve maternal health

[W]e resolve to promote gender equality and eliminate pervasive gender discrimination by . . . ensuring equal access to reproductive health.

—United Nations World Summit Outcome (2005)

Target 5A
Reduce by three-quarters,
between 1990 and 2015, the
maternal mortality ratio

Every year more than 500,000 women die from complications of pregnancy or childbirth, almost all of them (99 percent) in developing countries. For each woman who dies, 30–50 women suffer injury, infection, or disease. Pregnancy-related complications are among the leading causes of death and disability for women ages 15–49 in developing countries.

Dangerous for mothers

About half of maternal deaths occur in Sub-Saharan Africa, and about a third in South Asia. Together the two regions accounted for 85 percent of maternal deaths in 2005. The causes of maternal death vary. Hemorrhage is the leading cause in South Asia and Sub-Saharan Africa, while hypertensive disorders during pregnancy and labor are more common in Latin America and the Caribbean.

Providing care to mothers

Skilled attendance at delivery is critical for reducing maternal mortality. Since 1990 every region has made some progress in improving the availability of skilled health personnel at child-birth. In developing countries births attended by skilled health staff rose from about 50 percent in 1990 to 66 percent in 2008. Countries in Europe and Central Asia have made the most progress in ensuring safe deliveries. Most have achieved universal coverage, and the rest are on track to achieve it by 2015. But the overall picture remains sobering. In South Asia and Sub-Saharan Africa more than half of births are not attended by skilled staff. And wealthy

women are more than twice as likely as the poorest women to have access to skilled health staff at childbirth.

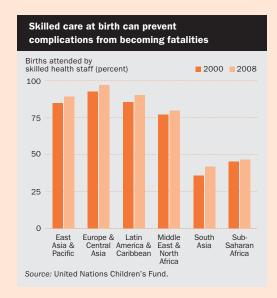

Many health problems among pregnant women are preventable and treatable through visits with trained health workers before child-birth. At least four visits would enable women to receive important services such as tetanus vaccinations, treatment of infections, and treatment for life-threatening complications. The proportion of pregnant women who had at least one antenatal visit rose from about 64 percent in 1990 to 79 percent in 2008. But the proportion who had four or more visits is still less than 50 percent in South Asia and Sub-Saharan Africa, where the majority of maternal deaths occur. The provision of reproductive health services is advancing very slowly in these regions.

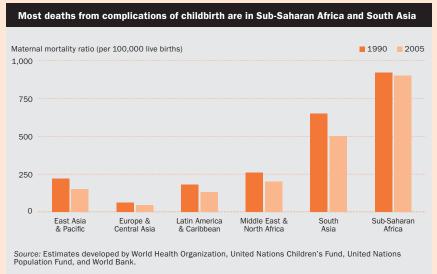

Target 5B
Achieve, by 2015, universal access to reproductive health

High risks for young mothers and their children

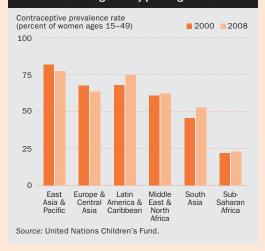

In developing countries women continue to die because they lack access to contraception. And early pregnancy multiplies the chance of dying in childbirth. Contraceptive use has increased in most developing countries for which data are available, generally accompanied by reductions in fertility. In almost all regions more than half of women who are married or in union use some method of birth control. The exception is Sub-Saharan Africa, where contraceptive prevalence has remained at a little over 20 percent.

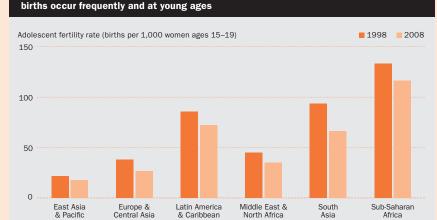

More than 200 million women want to delay or cease childbearing—roughly one in six women of reproductive age. Substantial proportions of women in every country—more than half in some—say that their last birth was unwanted or mistimed. More than a quarter of these pregnancies, about 52 million annually, end in abortion. About 13 percent of maternal deaths are attributed to unsafe abortions, and young women are especially vulnerable.

Contraceptive use has increased, but many women are still unable to get family planning services

The risks are higher for both mother and child when

Goal 6 Combat HIV/AIDS, malaria, and other diseases

We recognize that HIV/AIDS, malaria, tuberculosis and other infectious diseases pose severe risks for the entire world and serious challenges to the achievement of development goals.

-United Nations World Summit Outcome (2005)

Target 6A
Have halted by 2015 and begun to reverse the spread of HIV/AIDS

Living with HIV/AIDS

Worldwide, some 33.4 million people—two-thirds of them in Sub-Saharan Africa and most of them women—are living with HIV/AIDS, but the prevalence rate has remained constant since 2000. There were 2.7 million new HIV infections in 2008, a 17 percent decline over eight years. In 14 of 17 African countries with adequate survey data the proportion of pregnant women ages 15-24 living with HIV/AIDS has declined since 2000-01. Some of the most worrisome increases in new infections are now occurring in populous countries in other regions, such as Indonesia, the Russian Federation, and some high-income countries. Even more worrisome, an estimated 370,000 children younger than age 15 became infected with HIV in 2007. Globally, the number rose from 1.6 million in 2001 to 2.0 million in 2007. Most of these children (90 percent) live in Sub-Saharan Africa.

Orphaned and vulnerable

Worldwide in 2008 some 17.5 million children had lost one or both parents to AIDS, including nearly 14.1 million children in Sub-Saharan Africa. A key indicator of progress in HIV/AIDS treatment and the situation of children affected by AIDS is school attendance by orphans. Orphans and vulnerable children are at higher risk of missing out on schooling, live in households with less food security, and are in greater danger of exposure to HIV. The disparity in school attendance between orphans and nonorphans appears to be shrinking in many countries.

Target 6B
Achieve by 2010 universal access to treatment for HIV/AIDS for all those who need it

Treating HIV/AIDS

Wider access to antiretroviral treatment has contributed to the first decline in AIDS deaths since the epidemic began. Coverage has improved substantially in Sub-Saharan Africa, but more than 60 percent of the population in need still do not have access to treatment.

Target 6C
Have halted by 2015 and begun
to reverse the incidence of
malaria and other diseases

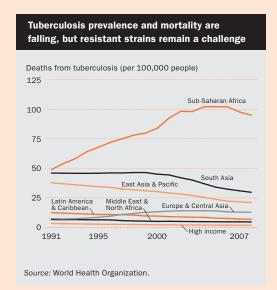

Curbing the toll of malaria

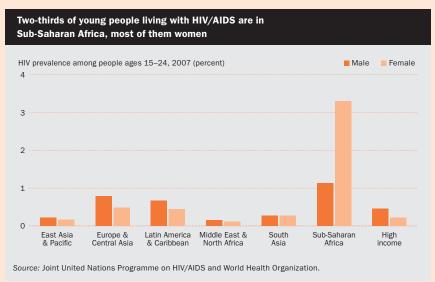

The World Health Organization estimates that in 2006 there were 190–330 million malaria episodes, leading to nearly 1 million malaria-related deaths. While malaria is endemic in most tropical and subtropical regions, 90 percent of malaria deaths occur in Sub-Saharan Africa, and most are among children under age 5.

Children who survive malaria do not escape unharmed. Repeated episodes of fever and anemia take a toll on their mental and physical development. Much progress has been made across Sub-Saharan Africa in scaling up insecticide-treated net use among children, which rose from 2 percent in 2000 to 20 percent in 2006. In countries with trend data, 19 of 22 countries showed at least a threefold increase over 2000–06, and 17 showed a fivefold increase.

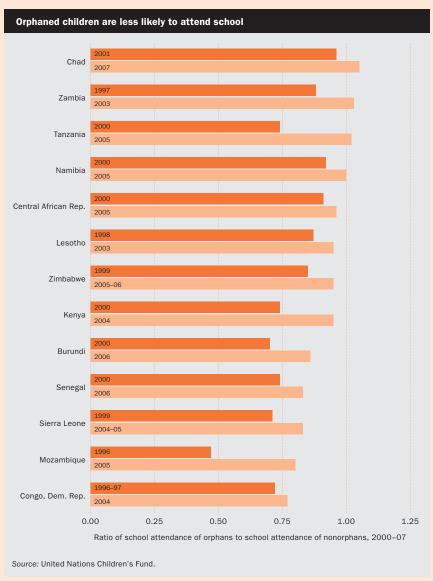

Tuberculosis rates falling, but not fast enough

The number of new tuberculosis cases globally peaked in 2004 and is leveling off. Tuberculosis prevalence (cases per 100,000 people) has fallen, but the target of halving 1990 prevalence and death rates by 2015 is unlikely to be met in all regions. Prevalence is still high in Sub-Saharan Africa, and South Asian countries appear to have just returned to 1990 prevalence levels in 2007. In 2007 there were 13.7 million cases globally, down only slightly from the 13.9 million in 2006, when 1.3 million infected people died. An estimated half million people who died were also HIV positive.

Goal 7 Ensure environmental sustainability

We must spare no effort to free all of humanity, and above all our children and grandchildren, from the threat of living on a planet irredeemably spoilt by human activities, and whose resources would no longer be sufficient for their needs.

—United Nations Millennium Declaration (2000)

Target 7A
Integrate the principles of
sustainable development
into country policies and
programs and reverse the loss
of environmental resources

International concern for the loss of environmental resources and the impact on human welfare was first expressed in 1972 at the UN Conference on the Human Environment. The 1992 "Earth Summit" in Rio de Janeiro adopted Agenda 21, a comprehensive blueprint of actions to be taken globally, nationally, and locally in every area in which humans directly affect the environment. Agenda 21 was incorporated into the Millennium Declaration along with a commitment to embark on the reductions in greenhouse gas emissions required under the Kyoto Protocol and to implement the conventions on biodiversity and desertification.

Forests lost

Loss of forests is one of the most tangible measures of environmental destruction. Many of the world's poor people depend on forests. The loss of forests threatens their livelihoods, destroys habitat that harbors biodiversity, and eliminates an important carbon sink that helps to moderate the climate. Net losses since 1990 have been substantial, especially in Latin America and the Caribbean and Sub-Saharan Africa, but recent data show a slowing in the global rate of deforestation.

Rising greenhouse gas emissions

The United Nations Framework Convention on Climate Change (UNFCCC) was agreed at the 1972 Earth Summit. Neither the UNFCCC nor the Millennium Development Goals commit countries to

specific targets for reducing emissions of greenhouse gases. And despite the commitments made by the 37 industrial countries that are parties to the 1997 Kyoto Protocol, emissions of greenhouse gases have continued to rise.

As economies develop, their use of energy derived from fossil fuels increases. Even with improved energy efficiency, which has lowered carbon dioxide emissions per unit of GDP, average emissions per person continue to rise. Without agreed and enforceable targets for reduced emissions, little progress will be made in reducing the threat of global climate change.

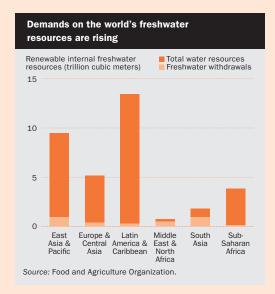

Greater demands on water resources

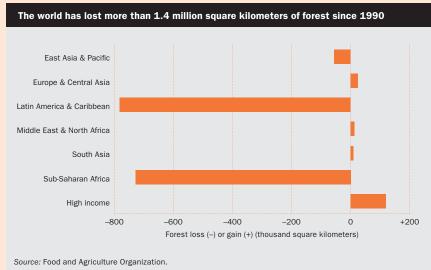

Most water is used for agriculture and industry, with only a small part going to domestic consumption. Growing economies and populations are putting greater demands on the world's freshwater resources. In 2007 there were 62 economies with less than 1,700 cubic meters of freshwater resources per person, a level associated with water stress. Of these, 41 were in water scarcity, with less than 1,000 cubic meters per person. Water pollution and wasteful practices further reduce available water. In some economies, especially in the Middle East and North Africa, withdrawals exceed available resources, and the difference is made up by desalinization of sea water.

Target 7B
Reduce biodiversity loss,
achieving, by 2010, a significant
reduction in the rate of loss

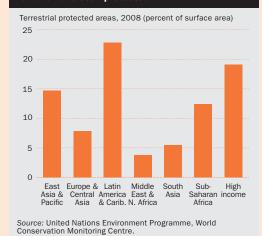

The loss of habitat for animal and plant species has led to widespread extinctions. Developing economies, especially those near the equator, contain some of the most important regions of biodiversity.

Preservation of habitat through the designation of protected areas is an important practical step to ensure sustainable development. The number and size of protected areas have increased, but there is no direct evidence that the rate of biodiversity loss has slowed.

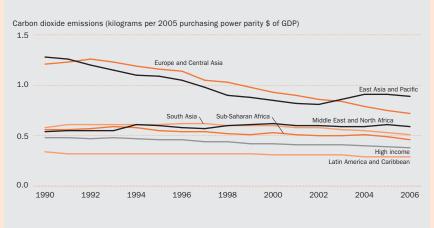

Some 18 million square kilometers of land have been protected . . .

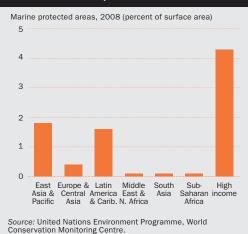

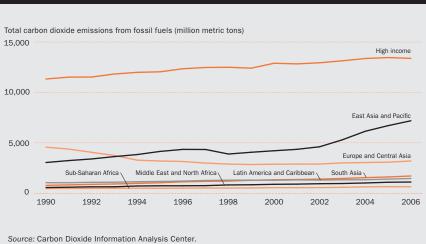

Source: Carbon Dioxide Information Analysis Center and World Bank staff calculations.

... but only 3 million square kilometers of marine areas are protected

Carbon dioxide emissions continue to rise

Goal 7 Ensure environmental sustainability

We will put into place policies to ensure adequate investment in a sustainable manner in health, clean water and sanitation . . .

—United Nations World Summit Outcome (2005)

... recognizing the urgent need for the provision of increased resources for affordable housing and housing-related infrastructure ...

—United Nations World Summit Outcome (2005)

Target 7C
Halve by 2015 the proportion
of people without sustainable
access to safe drinking
water and basic sanitation

More people have access to an improved water source

In 1990 almost 1 billion people in developing countries lacked convenient access to an adequate daily supply of water from an improved source. The numbers lacking access have been declining. At least 65 developing countries are on track to reduce by half the proportion of people lacking access to an improved water source, and others could still reach the target by 2015.

But an "improved source" does not always mean a source of safe water. Water from improved sources, such as public taps or hand pumps and tubewells, may not meet standards of water quality set by the World Health Organization. Such sources may also require much fetching and carrying of water: many people, especially in rural areas, still do not have the convenience of piped water in their homes.

Access to improved sanitation has proved more difficult

More than 1.5 billion people lack access to toilets, latrines, and other forms of improved

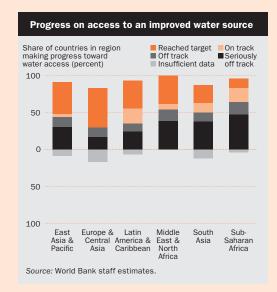

sanitation, a number that has barely changed since 1990. In developing countries the proportion of the population without access to improved sanitation fell from 55 percent in 1990 to 45 percent in 2006. To reach the target in 2015, more than 1.1 billion more people will have to gain access to an improved facility. Progress has been slowest in South Asia and Sub-Saharan Africa.

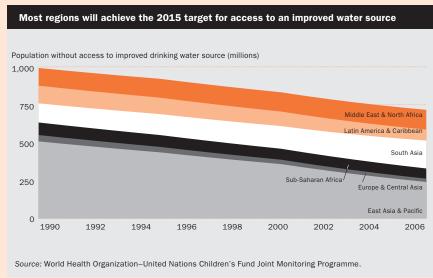

Even as countries try to improve their sanitation systems, 18 percent of the world's population lack any form of sanitation. They practice open defecation, at great risk to their own health and to that of others around them.

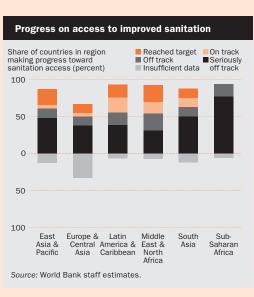

Target 7D
Achieve by 2020 a significant improvement in the lives of at least 100 million slum dwellers

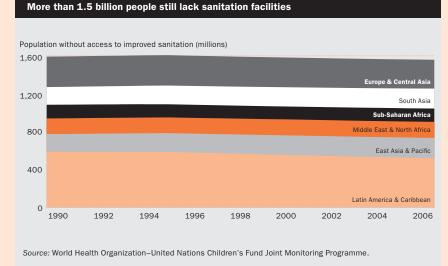

A growing need for urban housing

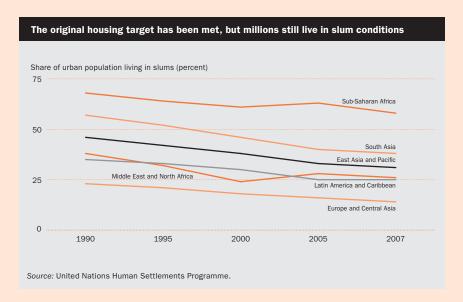

The Millennium Declaration adopted the goal of the "Cities without Slums" initiative, to improve the lives of 100 million slum dwellers, although at the time there was no standard definition of a slum. Since then work by the United Nations Human Settlements Programme (UN-HABITAT) has helped quantify the number of people living in urban slums. That evidence suggests that more than 200 million urban dwellers have enjoyed improved living conditions, but the number of people moving into urban areas has grown even faster. UN-HABITAT estimates that more than 825 million people are now living in dwellings that lack access to an improved drinking water source, improved sanitation facilities, sufficient living area, durable structure, or security of tenure. In Sub-Saharan Africa more than half the urban population lives in slum conditions.

Goal 8 Develop a global partnership for development

Success in meeting these objectives depends, inter alia, on good governance within each country. It also depends on good governance at the international level and on transparency in the financial, monetary and trading systems. We are committed to an open, equitable, rule-based, predictable and nondiscriminatory multilateral trading and financial system.

—United Nations Millennium Declaration (2000)

Official development assistance

Following the Millennium Summit, world leaders meeting at Monterrey, Mexico, in 2002 agreed on the need to provide financing for development through a coherent process that recognized the need for domestic as well as international resources. These leaders called on rich countries to increase aid levels to 0.7 percent of their gross national income (GNI), but only a few have. Three years later, the leaders of the Group of Eight industrialized countries meeting in Gleneagles, Scotland, made specific commitments to increase aid flows to Africa. Aid flows have increased substantially since 2000—from \$69 billion in 2000 to \$122 billion in 2008 (in 2007 dollars). While aid flows to Africa have increased, at \$38 billion in 2008 they have fallen well short of the Gleneagles commitments.

Market access

The world economy is bound together by trade and investment. To improve the opportunities for developing countries, the Millennium Declaration calls for rich countries to permit tariff- and duty-free access of the exports of developing countries and draws attention to the need for assistance to improve countries' capacity to export.

Average tariffs levied by rich countries have been falling, but many obstacles remain for developing country exporters. The averages

disguise high peak tariffs applied selectively to certain goods. Arcane rules of origin may also prevent countries from qualifying for duty-free access. And subsidies paid by rich countries to agricultural producers make it hard for developing countries to compete. Though falling, subsidies are still much higher than the level of aid provided by the same counties.

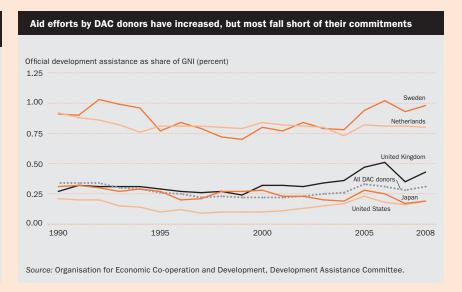

Debt sustainability

Better debt management, trade expansion, and, for the poorest countries, substantial debt relief have reduced the burden of debt service. The slowdown in the global economy since 2007 is likely to reverse these trends in the near term and increase the difficulties of servicing debt or borrowing to finance balance of payments deficits, especially for countries with above average debt levels. Debt relief under the Heavily Indebted Poor Countries Initiative has reduced future debt payments by \$57 billion (in end-2008 net present value terms) for 35 countries that have reached their decision point. And 28 countries that have also reached the completion point have received additional assistance of \$25 billion (in end-2008 net present value terms) under the Multilateral Debt Relief Initiative.

Access to technology

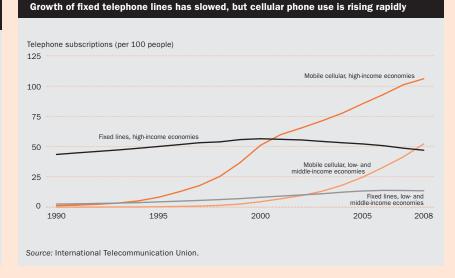

If trade and investment provide the economic sinews that bind the world together, communications is the nerve tissue, relaying messages from the most remote parts of the planet. While the growth of fixed-line systems has peaked in high-income economies and slowed appreciably in developing countries, mobile cellular subscriptions continue to grow at a rapid pace, and Internet use, barely under way in 2000, is now spreading through many developing countries.

Millennium Development Goals and inequality

The first cross-cutting challenge for quality of life indicators is to detail the inequalities in individual conditions in the various dimensions of life, rather than just the average conditions in each country. To some extent, the failure to account for these inequalities explains the "growing gap" . . . between the aggregate statistics that dominate policy discussions and people's sentiments about their own condition.

Report by the Commission on the Measurement of Economic Performance and Social Progress (Stiglitz, Sen, and Fitoussi 2009), September 14, 2009

Although goal 1 includes a measure of income inequality, the MDGs do not directly address differences in outcome associated with socioeconomic status, race, religion, or ethnic identity, although goal 3 addresses gender inequality. For nearly all the goals, the indicators used to monitor them may conceal large disparities within populations. Country averages obscure

differences between urban and rural areas, among religions and ethnic groups, between the sexes (figure 1f), and almost always between the rich and the poor. The degree of inequality varies from country to country, but within each country it is usually the poor who fare the worst (World Bank and IMF 2007).

Child death rates have fallen in low- and middle-income countries from 100 per 1.000 live births in 1990 to 75 in 2008, but they are falling less rapidly for the very poor (figure 1g). Poor people have less access to health services. They are more exposed to health risks because of malnutrition, high treatment costs, and long distances to health clinics. Some programs can be targeted to reach the most needy-oral rehydration therapy has been successful in reaching poor children and Brazil has improved income distribution (box 1h)—but large disparities remain. More midwives attend births in richer than in poorer areas of countries (Watkins 2008). Similarly, while primary school completion rates rose between 1991 and 2008 in low- and middle-income countries from an average of 78 percent to 86 percent (see table 1.2), in 36 countries primary completion rates were 20 or more percentage points higher for the richest quintile than the poorest (see table 2.15). The probability that a poor Tanzanian child will complete primary school is less than one in three, whereas almost all rich Tanzanian children complete primary school. Large gaps persist between the rich and the poor in the gross intake rate in grade 1, average years of schooling, and out of school children (see table 2.15). In Mali nearly 7 of 10 children ages 6-11 in the poorest 20 percent of the population are out of school, compared with 2 of 10 in the richest 20 percent.

An equity-based measure of the Millennium Development Goals

In a world of great inequality progress on the MDG indicators does not guarantee that poor people will be better off. Some countries could attain the MDG targets largely by improving outcomes for the richest 60 percent of the population, without improving conditions for the poor.

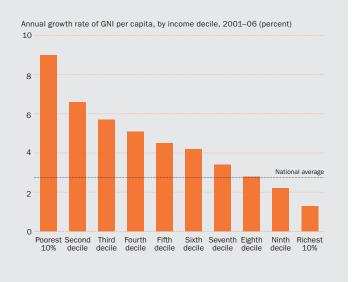

Until the late 1990s difficulties measuring income and consumption had inhibited assessment of economic inequalities. Then researchers found that information about readily observable household characteristics such as the type of roof or possessions such as radios and bicycles

Brazil improves income distribution

1h

While income inequalities have worsened in most middle-income countries, Brazil has seen dramatic improvements in both poverty and income distribution. Brazil's poverty rate fell from 41 percent in the early 1990s to 33–34 percent in 1995, where it stayed until 2003, when a steady decline began that lowered the poverty rate to 25.6 percent by 2006. Extreme poverty rates followed a similar path, falling from 14.5 percent in 2003 to 9.1 percent in 2006. Using the World Bank's global definition of poverty of living on less than \$1 a day, the poverty headcount ratio dropped steadily from 14 percent in 1990 to 8 percent in 2004. Reductions in the number of people living in poverty have been accompanied by a decline in income inequality as measured by the Gini index, from 0.60 in 2002 to 0.54 in 2006. Income growth for the poorest 10 percent outstripped income growth for the richest 10 percent (see figure).

Lower poverty and more equitable income distribution have been fueled by low inflation, a targeted transfer program (including Bolsa Famillia, a conditional cash transfer program), improvements in labor productivity following gains in schooling, and better integration of labor markets across Brazil. Inequality remains among the highest in the world, but recent improvements show that inequality does not inevitably accompany development. Social indicators have improved as well. Child mortality rates fell sharply, from 56 per 1,000 in 1990 to 22 in 2008, in part reflecting better immunization rates. Births attended by skilled health staff rose to 97 percent. Primary completion rates rose 90 percent in 1990 to universal coverage.

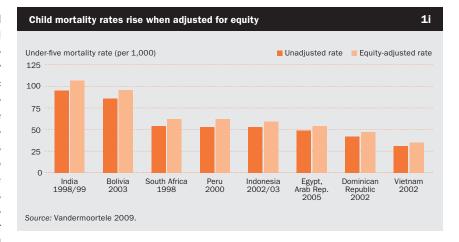

Source: World Bank 2008a.

could provide a reliable measure of household wealth and a reasonable proxy for household income and consumption data. An index constructed from these physical indicators is now widely used to analyze data from Demographic and Health Surveys and Multiple Indicator Cluster Surveys wealth quintiles. Jan Vandermoortele (2009) has suggested adjusting national averages by assigning greater weight to the scores of the poor. Giving a score of 30 instead of 20 to the poorest quintile and 10 instead of 20 to the richest quintile, with intermediate quintile scores of 25, 20, and 15, enables the weighted average to better measure progress by the poorer quintiles. Figure 1i shows how average child mortality rates would be adjusted for selected countries. The adjusted measure would credit countries making more rapid progress in improving the outcomes of the poor with making faster progress toward the MDG targets. This or other methods of adjusting for distributional patterns are worth exploring for future use.

Inequality in access to health and education services is mirrored by unevenness in the quality of services delivered. Education quality has lagged behind the substantial quantitative progress in access to schools. Quality as measured by differences in cognitive skills is not just a richpoor issue in developing countries: it is also a source of huge disparities between developed

and developing countries. The duration and curriculum of primary schooling reflect the need for children to acquire competencies in basic knowledge, skills, values, and behavior. Thus the importance of ensuring that all children complete at least the primary stage of schooling.

Yet the evidence suggests that merely attaining 100 percent primary completion rates, which many developing countries are on track to do, will not ensure that children acquire the necessary competencies. The expansion of education systems, including the building of schools and hiring and training of teachers, is a popular and appropriate strategy for meeting the MDG target. But promoting learning and the acquisition of competencies is a much more difficult challenge. Reading comprehension

tests organized under the Programme for International Student Assessment show that on a scale of 1 (low) to 5 (high), some 15 percent of students in rich countries scored below level 1, while 45 percent of students in Asian countries and 54 percent in Latin American and Caribbean countries did (Watkins 2008). In a recent survey of students in grades 6–8 in government schools in India, 31 percent of students who had completed primary education could not read a simple story and 29 percent could not do two-digit subtraction—competencies they should have acquired by grade 2. Similar results emerge from other testing.

Low education quality reflects resource constraints and weak management. These lead to poor infrastructure, high pupil-teacher ratios, and poorly trained, paid, and motivated teachers, resulting in teacher absenteeism and low-quality teaching. This erodes the implicit MDG target of achieving universal competencies. Low-quality schooling also leads to high levels of repetition and drop-out and weakens the demand for education from parents. Poor people pay the greatest price for low quality because their children are the most likely to attend the worst schools. This is not to suggest that the focus should shift from quantity to quality. The two need to go together. More effort is also needed to monitor student learning through national and international assessments and benchmarking to create stronger incentives for better performance.

Quality is of equal concern in health care, though data are still hard to collect. There is considerable evidence of widespread misdiagnosis of ailments and failure to adhere to recommended protocols or checklists for treatment of major diseases. High maternal mortality ratios through much of South Asia and Sub-Saharan Africa reflect poor-quality care that is not directly measured in the MDGs. The number of antenatal visits is measured but not their quality. The proportions of births attended by skilled attendants are monitored, but not the practices followed. This poor state of health information systems has resulted in a dependence on surveys, which take place at long intervals and do not capture moment of care data (Shankar and others 2008). An upgrade in locally based health information systems is needed to provide real-time data on delivery practices, care, and outcome to improve practices and reduce maternal and infant mortality.

Governance and fragility

Reaching poor people and ensuring that the services they receive improve human outcomes depend on governments discharging their responsibility to their citizens. This is more than a matter of ensuring economic growth, although growth and per capita incomes are closely associated with improved education and health outcomes. And it is more than a matter of public spending. although financing is a critical input. It is also a matter of ensuring that the money is well spent and achieves the intended objectives. And that requires strong governance and public accountability between citizens and their elected governments, between governments and service providers, and between service providers and citizens. To meet the MDGs, governments need to provide the physical and human infrastructure to improve access to schools and public health facilities, but they also need to provide incentives for the efficient delivery of services and to be responsive to public complaints about service provision.

Countries that underperform on health and education outcomes often have poor governance. Cameroon, for example, is a lower middle-income country whose pattern of health outcomes matches that of countries that are far poorer. Its under-five mortality rate of 131 per 1,000 is above the average for low-income countries and almost double the average for lower middle-income countries, while the under-five mortality rate for the poorest 20 percent (189 per 1,000) was more than twice the average for the richest (88) in 2006. The maternal mortality ratio is also high (669 per 100,000) despite improving indicators for prenatal care and births attended by skilled health staff. These poor health outcomes reflect in part low public spending: less than 1 percent of GDP in 2007, compared with an average of 2.4 percent for Sub-Saharan Africa and 1.8 percent for lower middle-income countries (see table 2.16). Resources are also poorly allocated, directed at centralized administration rather than front-line workers. But poor governance drives many of these outcomes as well. As in many developing countries citizens needing health care must pay high "informal payments." Drugs and procurement are major sources of illegally diverted funds.

Measuring governance is not easy, involving many institutions and formal and informal rules that guide their operation. Formal rules are easier to observe and measure. Informal rules, steeped in a country's culture and history, are

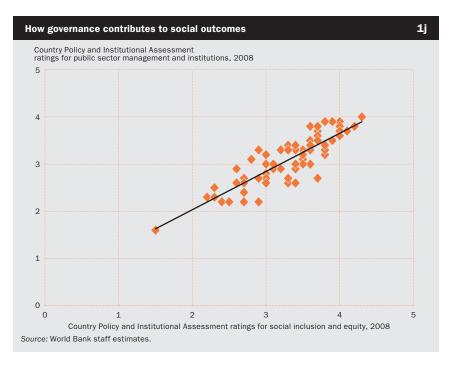

less easy to observe but may have a greater impact. Efforts are being made to measure governance. The World Bank's Country Policy and Institutional Assessment measure (see table 5.9) provides two sets of indicators of the relationship between governance and social indicators. One set captures dimensions of governance that influence social outcomes, such as the quality of budgetary and financial management, the efficiency of revenue mobilization, the quality of public administration, and corruption. Another set captures policies for social inclusion and equity directed at such outcomes as gender equality, equity of public resource use, human capacity building, social protection and labor, and policies for environmental sustainability. The relationship between the two indicator sets is close (figure 1j). While some countries appear to have strong social policies and outcomes despite poor governance (Bangladesh is an example), in most cases better governance goes with better policies and outcomes.

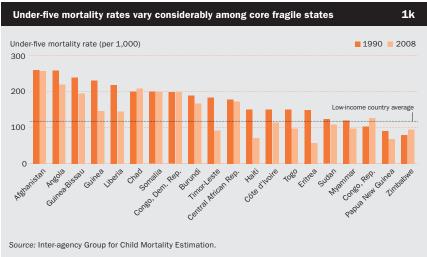

Countries facing particularly severe development challenges—weak institutional capacity, poor governance, political instability, and conflict—are sometimes referred to as fragile states. They are least likely to achieve the MDGs. The 2010 list of core fragile states accounts for only 6 percent of the population of developing countries but for more than 12 percent of the extreme poor. They account for 21 percent of child deaths in developing countries and 20 percent of children who did not complete primary school on time. Fragile states make up a majority of the low-income countries that will not achieve the goal of gender parity in primary and secondary schools. This lack of progress reflects weak governance, low institutional capacity, and frequent internal and sometimes external conflicts.

This is not to suggest that fragile states have a uniformly poor record on the MDGs. The performance of 20 large (more than 1 million population) fragile states on under-five mortality shows that child mortality increased in 3 countries and showed little or no progress in 9, but improved in 8 to a level below the average for low-income countries (figure 1k).

Building capacity for better data

The second half of the 1990s saw a marked increase in demand for reliable data to design poverty reduction programs and demonstrate their effectiveness. Developing country governments faced both domestic and external

pressure to produce better data and monitor development outcomes more systematically. Increasingly, the need for improved statistical capacity building began to emerge from poverty reduction strategies supported by grants and concessional funding from the International Monetary Fund and the World Bank, and United Nations development assistance frameworks. In response, the Partnership in Statistics for Development in the 21st Century (PARIS21) was created in November 1999 to bring together donors and developing countries to promote statistical capacity-building programs.

Adoption of the MDGs gave new momentum to the demand for better data. A series of

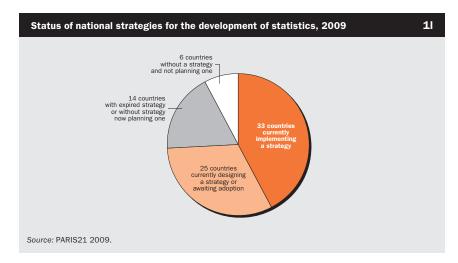

Managing for Development Results conferences produced a Marrakech Action Plan calling for:

- All low-income countries to develop and implement national strategies for the development of statistics.
- All low-income countries to participate in censuses in 2010.
- Greater domestic and foreign financing for statistical capacity building.
- Establishment of an International Household Survey Network to help countries learn from each other and benchmark their progress.
- · Major improvements in MDG monitoring.
- Increased accountability of the international statistical system.

Progress in designing and implementing national strategies for statistics has been impressive (figure 1I). Some 42 percent of the 78 International Development Association (IDA)—eligible countries are already implementing a strategy, and 32 percent are designing a strategy or awaiting its adoption.

Measuring progress in statistical capacity building

Developing a strategy is only the beginning. Implementation calls for increased investment to address structural and capacity constraints. Strategies must be effectively linked to government budgets and action plans. Progress in improving institutional capacity through better practices and better data collection was modest over the decade (table 1m). The major area of improvement was in the availability of data. Countries in Europe and Central Asia and Latin America and the Caribbean also greatly improved their scores on practice and collection and South Asia on collection.

To ensure that the increased efforts and donor financing for statistical capacity development are producing results, the World Bank launched a statistical capacity indicator in 2004 based on information that is easily collected and publicly available in most countries. The indicator combines three measures of statistical capacity:

- Practice, a measure of a country's capacity to meet international standards, methods, and data reporting practices in economic and social statistics.
- Collection, a measure of a country's ability to collect data at recommended intervals.
- Availability, a measure of a country's capacity to make data available and accessible to users in international data sources such as World Development Indicators.

Over 1999–2009 the statistical capacity index for 117 World Bank borrower countries rose from 52 to 65. Progress was faster in non-Sub-Saharan IDA countries (up 20 percentage points) than in Sub-Saharan IDA countries (up 6 percentage points). Of 42 Sub-Saharan African countries with statistical capacity data for both 1999 and 2009, 12 saw a decline and 8 barely improved. However, several Sub-Saharan countries recorded substantial improvements. The predominance of core fragile states in Sub-Saharan Africa contributed to the poor scores. Some 16 core fragile states saw a modest improvement over the decade (up 6 percentage points). A few exceptions—Afghanistan, Burundi, Republic of Congo, and Liberia—saw substantial increases in their statistical capacity index, albeit from a low base (figure 1n).

Data availability improves

Data availability has improved considerably. The United Nations Educational, Scientific, and Cultural Organization has reported a substantial increase in the availability of enrollment data. The number of countries conducting health-related surveys at least every three years has doubled.

Thus, MDG-related data are becoming more available. In 2003 only 4 countries had two data points for 16 or more of the 22 MDG indicators. Today, some 118 countries (72 percent) have two data points for the 16–22 indicators grouping (figure 10). Improvements in statistical capacity have been accompanied by improvements in reporting to international agencies and increased access and understanding in these agencies of national sources (PARIS21 2009).

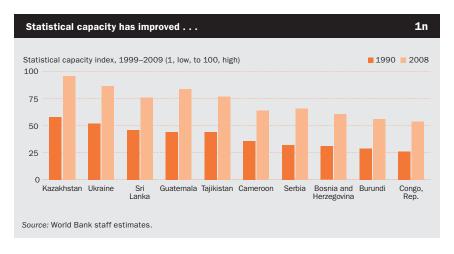

Chadiatical associtor	All countries		East Asia		Europ Centra		Latin America and the Caribbean		Middle E North		South	ı Asia	Sub-Saha	ran Afric

Overall	52	65	55	68	55	79	62	75	49	59	50	68	47	54
Practice	45	56	50	63	51	76	53	68	46	55	43	58	36	38
Collection	53	63	56	65	63	81	65	75	45	55	50	72	45	48
Availability	59	77	59	76	50	80	68	84	55	68	56	73	61	75

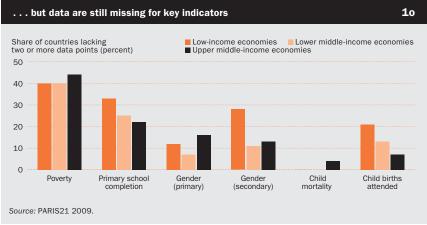

The effort to get low-income countries to participate in 2010 censuses promises to greatly improve global coverage. Only nine countries have not yet scheduled a census (seven also did not participate in 2000). PARIS21 (2009) estimates that some 140 million people will not be covered by the 2010 censuses, well down from the 550 million in the 2000 censuses.

Data quality remains uncertain

Despite this impressive progress, data quality remains a concern. "Far too much of the growing amount of data cited in high-level reports is still based on poor quality information, extrapolation, and guesswork" (Manning 2009, p. 38). Strengthening national statistical systems must go beyond producing a few high-profile statistics to improving the underlying processes. This includes the sectoral agencies responsible for delivering services and collecting data on the population served. A heavy reliance on household surveys-which can produce high-quality data but at greater cost and lower frequency than national statistical systems may be necessary to compensate for a lack of vital registration systems and reliable administrative systems. But if the main source of information is surveys that take place only every three to five years, it is difficult to reward good performance or correct poor performance. There is a "growing mismatch between the multiple demands for monitoring and the ability of local systems to generate credible data" (Manning 2009, p. 38).

The best assurance of high-quality data is an independent and well managed statistical system that adheres to recognized standards, uses a variety of instruments (surveys, censuses, and administrative records), documents its processes, and publishes its results. High-quality systems do not exist in a vacuum. Users must demand reliable data and recognize their

value. And someone—usually the government—must be willing to pay for them. Statistics are the classic example of a public good, which can be shared by many without loss to any—but they are still costly to produce. The MDGs have helped to raise the profile of statistics and the agencies that produce them, but the achievements of the last two decades are far from secure. Without continuous improvement and a strong commitment to producing useful, high-quality data, statistical systems will languish. Public and private sectors will be the poorer for it.

Millennium Development Goals

Goals an	d targets from the Millennium Declaration	Indi	cators for monitoring progress
Goal 1	Eradicate extreme poverty and hunger		
Target 1.A	Halve, between 1990 and 2015, the proportion of people whose income is less than \$1 a day	1.1 1.2 1.3	Proportion of population below \$1 purchasing power parity (PPP) a day ¹ Poverty gap ratio [incidence × depth of poverty] Share of poorest quintile in national consumption
Target 1.B	Achieve full and productive employment and decent work for all, including women and young people	1.4 1.5 1.6 1.7	Growth rate of GDP per person employed Employment to population ratio Proportion of employed people living below \$1 (PPP) a day Proportion of own-account and contributing family workers in total employment
Target 1.C	Halve, between 1990 and 2015, the proportion of people who suffer from hunger	1.8 1.9	Prevalence of underweight children under five years of age Proportion of population below minimum level of dietary energy consumption
Goal 2	Achieve universal primary education		
Target 2.A	Ensure that by 2015 children everywhere, boys and girls alike, will be able to complete a full course of primary schooling	2.1 2.2 2.3	Net enrollment ratio in primary education Proportion of pupils starting grade 1 who reach last grade of primary education Literacy rate of 15- to 24-year-olds, women and men
Goal 3	Promote gender equality and empower women		
Target 3.A	Eliminate gender disparity in primary and secondary education, preferably by 2005, and in all levels of education no later than 2015	3.1	Ratios of girls to boys in primary, secondary, and tertiary education Share of women in wage employment in the
		3.3	nonagricultural sector Proportion of seats held by women in national parliament
Goal 4	Reduce child mortality		
Target 4.A	Reduce by two-thirds, between 1990 and 2015, the under-five mortality rate	4.1 4.2 4.3	Under-five mortality rate Infant mortality rate Proportion of one-year-old children immunized against measles
Goal 5	Improve maternal health		
Target 5.A	Reduce by three-quarters, between 1990 and 2015, the maternal mortality ratio	5.1 5.2	Maternal mortality ratio Proportion of births attended by skilled health personnel
Target 5.B	Achieve by 2015 universal access to reproductive health	5.3 5.4 5.5 5.6	Contraceptive prevalence rate Adolescent birth rate Antenatal care coverage (at least one visit and at least four visits) Unmet need for family planning
Goal 6	Combat HIV/AIDS, malaria, and other diseases		
Target 6.A	Have halted by 2015 and begun to reverse the spread of HIV/AIDS	6.1 6.2 6.3	HIV prevalence among population ages 15–24 years Condom use at last high-risk sex Proportion of population ages 15–24 years with
		6.4	comprehensive, correct knowledge of HIV/AIDS Ratio of school attendance of orphans to school attendance of nonorphans ages 10–14 years
Target 6.B	Achieve by 2010 universal access to treatment for HIV/AIDS for all those who need it	6.5	Proportion of population with advanced HIV infection with access to antiretroviral drugs
Target 6.C	Have halted by 2015 and begun to reverse the	6.6	Incidence and death rates associated with malaria
	incidence of malaria and other major diseases	6.7 6.8	Proportion of children under age five sleeping under insecticide-treated bednets Proportion of children under age five with fever who are
		6.9	treated with appropriate antimalarial drugs Incidence, prevalence, and death rates associated with
		6.10	tuberculosis Proportion of tuberculosis cases detected and cured under directly observed treatment short course

The Millennium Development Goals and targets come from the Millennium Declaration, signed by 189 countries, including 147 heads of state and government, in September 2000 (www. un.org/millennium/declaration/ares552e.htm) as updated by the 60th UN General Assembly in September 2005. The revised Millennium Development Goal (MDG) monitoring framework shown here, including new targets and indicators, was presented to the 62nd General Assembly, with new numbering as recommended by the Inter-agency and Expert Group on MDG Indicators at its 12th meeting on 14 November 2007. The goals and targets are interrelated and should be seen as a whole. They represent a partnership between the developed countries and the developing countries "to create an environment—at the national and global levels alike—which is conducive to development and the elimination of poverty." All indicators should be disaggregated by sex and urban-rural location as far as possible.

Goal 7	Ensure environmental sustainability	
Target 7.A	Integrate the principles of sustainable development into country policies and programs and reverse the loss of environmental resources	 7.1 Proportion of land area covered by forest 7.2 Carbon dioxide emissions, total, per capita and per \$1 GDP (PPP) 7.3 Consumption of ozone-depleting substances
Target 7.B	Reduce biodiversity loss, achieving, by 2010, a significant reduction in the rate of loss	 7.4 Proportion of fish stocks within safe biological limits 7.5 Proportion of total water resources used 7.6 Proportion of terrestrial and marine areas protected 7.7 Proportion of species threatened with extinction
Target 7.C	Halve by 2015 the proportion of people without sustainable access to safe drinking water and basic sanitation	 7.8 Proportion of population using an improved drinking water source 7.9 Proportion of population using an improved sanitation facility
Target 7.D	Achieve by 2020 a significant improvement in the lives of at least 100 million slum dwellers	7.10 Proportion of urban population living in slums ²
Goal 8	Develop a global partnership for development	
Target 8.A	Develop further an open, rule-based, predictable, nondiscriminatory trading and financial system (Includes a commitment to good governance, development, and poverty reduction—both nationally and internationally.)	Some of the indicators listed below are monitored separately for the least developed countries (LDCs), Africa, landlocked developing countries, and small island developing states. Official development assistance (ODA) 8.1 Net ODA, total and to the least developed countries, as percentage of OECD/DAC donors' gross national income 8.2 Proportion of total bilateral, sector-allocable ODA of OECD/DAC donors to basic social services (basic
Target 8.B	Address the special needs of the least developed countries (Includes tariff and quota-free access for the least developed countries' exports; enhanced program of debt relief for heavily indebted poor countries (HIPC) and cancellation of official bilateral debt; and more generous ODA for countries committed to poverty reduction.)	education, primary health care, nutrition, safe water, and sanitation) 8.3 Proportion of bilateral official development assistance of OECD/DAC donors that is untied 8.4 ODA received in landlocked developing countries as a proportion of their gross national incomes 8.5 ODA received in small island developing states as a proportion of their gross national incomes
Target 8.C	Address the special needs of landlocked developing countries and small island developing states (through the Programme of Action for the Sustainable Development of Small Island Developing States and the outcome of the 22nd special session of the General Assembly)	 Market access 8.6 Proportion of total developed country imports (by value and excluding arms) from developing countries and least developed countries, admitted free of duty 8.7 Average tariffs imposed by developed countries on agricultural products and textiles and clothing from developing countries 8.8 Agricultural support estimate for OECD countries as a percentage of their GDP 8.9 Proportion of ODA provided to help build trade capacity
Target 8.D	Deal comprehensively with the debt problems of developing countries through national and international measures in order to make debt sustainable in the long term	Debt sustainability 8.10 Total number of countries that have reached their HIPC decision points and number that have reached their HIPC completion points (cumulative) 8.11 Debt relief committed under HIPC Initiative and Multilateral Debt Relief Initiative (MDRI) 8.12 Debt service as a percentage of exports of goods and services
Target 8.E	In cooperation with pharmaceutical companies, provide access to affordable essential drugs in developing countries	8.13 Proportion of population with access to affordable essential drugs on a sustainable basis
Target 8.F	In cooperation with the private sector, make available the benefits of new technologies, especially information and communications	8.14 Telephone lines per 100 population 8.15 Cellular subscribers per 100 population 8.16 Internet users per 100 population

 $^{{\}bf 1.}\ Where\ available,\ indicators\ based\ on\ national\ poverty\ lines\ should\ be\ used\ for\ monitoring\ country\ poverty\ trends.$

^{2.} The proportion of people living in slums is measured by a proxy, represented by the urban population living in households with at least one of these characteristics: lack of access to improved water supply, lack of access to improved sanitation, overcrowding (3 or more persons per room), and dwellings made of nondurable material.

a. Based on regression; others are extrapolated from the 2005 International Comparison Program benchmark estimates. b. Private analysts estimate that GDP volume growth has been significantly lower than official reports have shown since the last quarter of 2008. c. Estimated to be upper middle income (\$3,856–\$11,905). d. Excludes the French overseas departments of French Guiana, Guadeloupe, Martinique, and Réunion. e. Estimated to be low income (\$976–\$3,855). g. Included in the aggregates for upper middle-income economies based on earlier data. h. Excludes Transnistria. Includes Former Spanish Sahara. j. Included in the aggregates for lower middle-income economies based on earlier data. h. Excludes Transnistria. Included in the aggregates for low-income economies based on earlier data. n. Covers mainland Tanzania only.

Population, land area, income, and output are basic measures of the size of an economy. They also provide a broad indication of actual and potential resources. Population, land area, income (as measured by gross national income, GNI), and output (as measured by gross domestic product, GDP) are therefore used throughout World Development Indicators to normalize other indicators.

Population estimates are generally based on extrapolations from the most recent national census. For further discussion of the measurement of population and population growth, see *About the data* for table 2.1.

The surface area of an economy includes inland bodies of water and some coastal waterways. Surface area thus differs from land area, which excludes bodies of water, and from gross area, which may include offshore territorial waters. Land area is particularly important for understanding an economy's agricultural capacity and the environmental effects of human activity. (For measures of land area and data on rural population density, land use, and agricultural productivity, see tables 3.1–3.3.) Innovations in satellite mapping and computer databases have resulted in more precise measurements of land and water areas.

GNI measures total domestic and foreign value added claimed by residents. GNI comprises GDP plus net receipts of primary income (compensation of employees and property income) from nonresident sources. The World Bank uses GNI per capita in U.S. dollars to classify countries for analytical purposes and to determine borrowing eligibility. For definitions of the income groups in World Development Indicators, see Users guide. For discussion of the usefulness of national income and output as measures of productivity or welfare, see About the data for tables 4.1 and 4.2.

When calculating GNI in U.S. dollars from GNI reported in national currencies, the World Bank follows the World Bank Atlas conversion method, using a three-year average of exchange rates to smooth the effects of transitory fluctuations in exchange rates. (For further discussion of the World Bank Atlas method, see Statistical methods.)

Because exchange rates do not always reflect differences in price levels between countries, the table also converts GNI and GNI per capita estimates into international dollars using purchasing power parity (PPP) rates. PPP rates provide a standard measure allowing comparison of real levels of expenditure between countries, just as

conventional price indexes allow comparison of real values over time.

PPP rates are calculated by simultaneously comparing the prices of similar goods and services among a large number of countries. In the most recent round of price surveys conducted by the International Comparison Program (ICP), 146 countries and territories participated in the data collection, including China for the first time, India for the first time since 1985, and almost all African countries. The PPP conversion factors presented in the table come from three sources. For 45 high- and upper middle-income countries conversion factors are provided by Eurostat and the Organisation for Economic Co-operation and Development (OECD), with PPP estimates for 34 European countries incorporating new price data collected since 2005. For the remaining 2005 ICP countries the PPP estimates are extrapolated from the 2005 ICP benchmark results, which account for relative price changes between each economy and the United States. For countries that did not participate in the 2005 ICP round, the PPP estimates are imputed using a statistical model.

More information on the results of the 2005 ICP is available at www.worldbank.org/data/icp.

All 210 economies shown in *World Development Indicators* are ranked by size, including those that appear in table 1.6. The ranks are shown only in table 1.1. No rank is shown for economies for which numerical estimates of GNI per capita are not published. Economies with missing data are included in the ranking at their approximate level, so that the relative order of other economies remains consistent.

Definitions

• Population is based on the de facto definition of population, which counts all residents regardless of legal status or citizenship—except for refugees not permanently settled in the country of asylum, who are generally considered part of the population of their country of origin. The values shown are midyear estimates. See also table 2.1. • Surface area is a country's total area, including areas under inland bodies of water and some coastal waterways. • Population density is midyear population divided by land area in square kilometers. • Gross national income (GNI) is the sum of value added by all resident producers plus any product taxes (less subsidies) not included in the valuation of output plus net receipts of primary income (compensation of employees and property income) from abroad. Data are in current U.S. dollars converted using the World Bank Atlas method (see Statistical methods). • GNI per capita is GNI divided by midyear population. GNI per capita in U.S. dollars is converted using the World Bank Atlas method. • Purchasing power parity (PPP) GNI is GNI converted to international dollars using PPP rates. An international dollar has the same purchasing power over GNI that a U.S. dollar has in the United States. • Gross domestic product (GDP) is the sum of value added by all resident producers plus any product taxes (less subsidies) not included in the valuation of output. Growth is calculated from constant price GDP data in local currency. • GDP per capita is GDP

Data sources

divided by midyear population.

Population estimates are prepared by World Bank staff from a variety of sources (see *Data sources* for table 2.1). Data on surface and land area are from the Food and Agriculture Organization (see *Data sources* for table 3.1). GNI, GNI per capita, GDP growth, and GDP per capita growth are estimated by World Bank staff based on national accounts data collected by World Bank staff during economic missions or reported by national statistical offices to other international organizations such as the OECD. PPP conversion factors are estimates by Eurostat/OECD and by World Bank staff based on data collected by the ICP.

Millennium Development Goals: 12 eradicating poverty and saving lives

About the data

Tables 1.2–1.4 present indicators for 17 of the 21 targets specified by the Millennium Development Goals. Each of the eight goals includes one or more targets, and each target has several associated indicators for monitoring progress toward the target. Most of the targets are set as a value of a specific indicator to be attained by a certain date. In some cases the target value is set relative to a level in 1990. In others it is set at an absolute level. Some of the targets for goals 7 and 8 have not yet been quantified.

The indicators in this table relate to goals 1-4. Goal 1 has three targets between 1990 and 2015: to halve the proportion of people whose income is less than \$1.25 a day, to achieve full and productive employment and decent work for all, and to halve the proportion of people who suffer from hunger. Estimates of poverty rates are in tables 2.7 and 2.8. The indicator shown here, the share of the poorest quintile in national consumption or income, is a distributional measure. Countries with more unequal distributions of consumption (or income) have a higher rate of poverty for a given average income. Vulnerable employment measures the portion of the labor force that receives the lowest wages and least security in employment. No single indicator captures the concept of suffering from hunger. Child malnutrition is a symptom of inadequate food supply, lack of essential nutrients, illnesses that deplete these nutrients, and undernourished mothers who give birth to underweight children.

Progress toward universal primary education is measured by the primary completion rate. Because many school systems do not record school completion on a consistent basis, it is estimated from the gross enrollment rate in the final grade of primary school, adjusted for repetition. Official enrollments sometimes differ significantly from attendance, and even school systems with high average enrollment ratios may have poor completion rates.

Eliminating gender disparities in education would help increase the status and capabilities of women. The ratio of female to male enrollments in primary and secondary school provides an imperfect measure of the relative accessibility of schooling for girls.

The targets for reducing under-five mortality rates are among the most challenging. Under-five mortality rates are harmonized estimates produced by a weighted least squares regression model and are available at regular intervals for most countries.

Most of the 60 indicators relating to the Millennium Development Goals can be found in *World Development Indicators*. Table 1.2a shows where to find the indicators for the first four goals. For more information about data collection methods and limitations, see *About the data* for the tables listed there. For information about the indicators for goals 5–8, see *About the data* for tables 1.3 and 1.4.

Definitions

· Share of poorest quintile in national consumption or income is the share of the poorest 20 percent of the population in consumption or, in some cases, income. • Vulnerable employment is the sum of unpaid family workers and own-account workers as a percentage of total employment. • Prevalence of malnutrition is the percentage of children under age 5 whose weight for age is more than two standard deviations below the median for the international reference population ages 0-59 months. The data are based on the new international child growth standards for infants and young children, called the Child Growth Standards, released in 2006 by the World Health Organization. • Primary completion rate is the percentage of students completing the last year of primary school. It is calculated as the total number of students in the last grade of primary school. minus the number of repeaters in that grade, divided by the total number of children of official graduation age. • Ratio of girls to boys enrollments in primary and secondary school is the ratio of the female to male gross enrollment rate in primary and secondary school. • Under-five mortality rate is the probability that a newborn baby will die before reaching age 5, if subject to current age-specific mortality rates. The probability is expressed as a rate per 1,000.

Location of indicators for Millennium Development Goals 1–4

Goal 1. Eradicate extreme poverty and hunger	Table
1.1 Proportion of population below \$1.25 a day	2.8
1.2 Poverty gap ratio	2.7, 2.8
1.3 Share of poorest quintile in national consumption	1.2, 2.9
1.4 Growth rate of GDP per person employed	2.4
1.5 Employment to population ratio	2.4
1.6 Proportion of employed people living below \$1 per day	_
1.7 Proportion of own-account and unpaid family workers in total employment	1.2, 2.4
1.8 Prevalence of underweight in children under age five	1.2, 2.20
1.9 Proportion of population below minimum level of dietary energy consumption	2.20
Goal 2. Achieve universal primary education	
2.1 Net enrollment ratio in primary education	2.12
2.2 Proportion of pupils starting grade 1 who reach last grade of primary	2.13
2.3 Literacy rate of 15- to 24-year-olds	2.14
Goal 3. Promote gender equality and empower women	
3.1 Ratio of girls to boys in primary, secondary, and tertiary education	1.2, 2.12*
3.2 Share of women in wage employment in the nonagricultural sector	1.5, 2.3*
3.3 Proportion of seats held by women in national parliament	1.5
Goal 4. Reduce child mortality	
4.1 Under-five mortality rate	1.2, 2.22
4.2 Infant mortality rate	2.22
4.3 Proportion of one-year-old children immunized against measles	2.18

— No data are available in the World Development Indicators database. * Table shows information on related indicators.

Data sources

The indicators here and throughout this book have been compiled by World Bank staff from primary and secondary sources. Efforts have been made to harmonize the data series used to compile this table with those published on the United Nations Millennium Development Goals Web site (www. un.org/millenniumgoals), but some differences in timing, sources, and definitions remain. For more information see the data sources for the indicators listed in table 1.2a.

Data are for the most recent year available. c. Includes Montenegro. d. Includes emissions not allocated to specific countries.

The Millennium Development Goals address concerns common to all economies. Diseases and environmental degradation do not respect national boundaries. Epidemic diseases, wherever they occur, pose a threat to people everywhere. And environmental damage in one location may affect the well-being of plants, animals, and humans far away. The indicators in the table relate to goals 5, 6, and 7 and the targets of goal 8 that address access to new technologies. For the other targets of goal 8, see table 1.4.

The target of achieving universal access to reproductive health has been added to goal 5 to address the importance of family planning and health services in improving maternal health and preventing maternal death. Women with multiple pregnancies are more likely to die in childbirth. Access to contraception is an important way to limit and space births.

Measuring disease prevalence or incidence can be difficult. Most developing economies lack reporting systems for monitoring diseases. Estimates are often derived from survey data and report data from sentinel sites, extrapolated to the general population. Tracking diseases such as HIV/AIDS, which has a long latency between contraction of the virus and the appearance of symptoms, or malaria, which has periods of dormancy, can be particularly difficult. The table shows the estimated prevalence of HIV among adults ages 15-49. Prevalence among older populations can be affected by life-prolonging treatment. The incidence of tuberculosis is based on case notifications and estimates of cases detected in the population.

Carbon dioxide emissions are the primary source of greenhouse gases, which contribute to global warming, threatening human and natural habitats. In recognition of the vulnerability of animal and plant species, a new target of reducing biodiversity loss has been added to goal 7.

Access to reliable supplies of safe drinking water and sanitary disposal of excreta are two of the most important means of improving human health and protecting the environment. Improved sanitation facilities prevent human, animal, and insect contact with excreta.

Internet use includes narrowband and broadband Internet. Narrowband is often limited to basic applications; broadband is essential to promote e-business, e-learning, e-government, and e-health.

Location of indicators for Millennium Development Goals 5–7 1.3a Goal 5. Definitions

- Maternal mortality ratio is the number of women who die from pregnancy-related causes during pregnancy and childbirth, per 100,000 live births. Data are from various years and adjusted to a common 2005 base year. The values are modeled estimates (see About the data for table 2.19). • Contraceptive prevalence rate is the percentage of women ages 15-49 married or in union who are practicing, or whose sexual partners are practicing, any form of contraception. • HIV prevalence is the percentage of people ages 15-49 who are infected with HIV. · Incidence of tuberculosis is the estimated number of new tuberculosis cases (pulmonary, smear posi-
- tive, and extrapulmonary). Carbon dioxide emissions are those stemming from the burning of fossil fuels and the manufacture of cement. They include emissions produced during consumption of solid, liquid, and gas fuels and gas flaring (see table 3.8).
- · Proportion of species threatened with extinction is the total number of threatened mammal (excluding whales and porpoises), bird, and higher native, vascular plant species as a percentage of the total number of known species of the same categories.
- · Access to improved sanitation facilities is the percentage of the population with at least adequate access to excreta disposal facilities (private or shared, but not public) that can effectively prevent human, animal, and insect contact with excreta (facilities do not have to include treatment to render sewage outflows innocuous). Improved facilities range from simple but protected pit latrines to flush toilets with a sewerage connection. To be effective, facilities must be correctly constructed and properly maintained. • Internet users are people with access to the worldwide network.

Data sources

The indicators here and throughout this book have been compiled by World Bank staff from primary and secondary sources. Efforts have been made to harmonize the data series used to compile this table with those published on the United Nations Millennium Development Goals Web site (www. un.org/millenniumgoals), but some differences in timing, sources, and definitions remain. For more information see the data sources for the indicators listed in table 1.3a.

a. Includes primary education, basic life skills for youth, adult and early childhood education, basic health care, basic health infrastructure, basic nutrition, infectious disease control, health education, health personnel development, population policy and administrative management, reproductive health care, family planning, sexually transmitted disease control including HIV/AIDS, personnel development for population and reproductive health, basic drinking water supply and basic sanitation, and multisector aid for basic social services. b. Provisional data. c. Calculated by World Bank staff using the World Integrated Trade Solution based on the United Nations Conference on Trade and Development's Trade Analysis and Information Systems database. d. Refers to the Enhanced HIPC Initiative. e. Data are in nominal terms because data in end-2008 net present value terms are unavailable. f. Also reached completion point under the original HIPC Initiative. The assistance includes original debt relief. g. Assistance includes topping up at completion point. h. Includes \$15 million (in nominal terms) of committed debt relief by the International Monetary Fund, converted to end-2008 net present value terms.

Millennium Development Goals: overcoming obstacles

About the data

Achieving the Millennium Development Goals requires an open, rule-based global economy in which all countries, rich and poor, participate. Many poor countries, lacking the resources to finance development, burdened by unsustainable debt, and unable to compete globally, need assistance from rich countries. For goal 8-develop a global partnership for development—many indicators therefore monitor the actions of members of the Organisation for Economic Co-operation and Development's (OECD) Development Assistance Committee (DAC).

Official development assistance (ODA) has risen in recent years as a share of donor countries' gross national income (GNI), but the poorest economies need additional assistance to achieve the Millennium Development Goals. Net ODA disbursements from DAC donors reached \$120 billion in 2008—the highest level ever-representing a 16 percent increase in nominal terms from the 2007 level.

One important action that high-income economies can take is to reduce barriers to exports from low- and middle-income economies. The European Union has begun to eliminate tariffs on developing economy exports of "everything but arms," and the United States offers special concessions to Sub-Saharan African exports. However, these programs still have many restrictions.

Average tariffs in the table reflect high-income OECD member tariff schedules for exports of countries designated least developed countries by the United Nations. Although average tariffs have been falling, averages may disguise high tariffs on specific goods (see table 6.8 for each country's share of tariff lines with "international peaks"). The averages in the table include ad valorem duties and equivalents.

Subsidies to agricultural producers and exporters in OECD countries are another barrier to developing economies' exports. Agricultural subsidies in OECD economies are estimated at \$376 billion in 2008.

The Debt Initiative for Heavily Indebted Poor Countries (HIPCs), an important step in placing debt relief within the framework of poverty reduction, is the first comprehensive approach to reducing the external debt of the world's poorest, most heavily indebted countries. A 1999 review led to an enhancement of the framework. In 2005, to further reduce the debt of HIPCs and provide resources for meeting the Millennium Development Goals, the Multilateral Debt Relief Initiative (MDRI), proposed by the Group of Eight countries, was launched.

Under the MDRI four multilateral institutions—the International Development Association (IDA), International Monetary Fund (IMF), African Development Fund (AfDF), and Inter-American Development Bank (IDB)—provide 100 percent debt relief on eligible debts due to them from countries having completed the HIPC Initiative process. Data in the table refer to status as of February 2010 and might not show countries that have since reached the decision or completion point. Debt relief under the HIPC Initiative has reduced future debt payments by \$57 billion (in end-2008 net present value terms) for 35 countries that have reached the decision point. And 28 countries that have reached the completion point have received additional assistance of \$25 billion (in end-2008 net present value terms) under the MDRI.

Definitions

• Net official development assistance (ODA) is grants and loans (net of repayments of principal) that meet the DAC definition of ODA and are made to countries on the DAC list of recipients. • ODA for basic social services is aid reported by DAC donors for basic education, primary health care, nutrition, population policies and programs, reproductive health, and water and sanitation services. • Goods admitted free of tariffs are exports of goods (excluding arms) from least developed countries admitted without tariff. . Average tariff is the unweighted average of the effectively applied rates for all products subject to tariffs. • Agricultural products are plant and animal products, including tree crops but excluding timber and fish products. • Textiles and clothing are natural and synthetic fibers and fabrics and articles of clothing made from them. • Support to agriculture is the value of gross transfers from taxpayers and consumers arising from policy measures, net of associated budgetary receipts, regardless of their objectives and impacts on farm production and income or consumption of farm products. • HIPC decision point is the date when a heavily indebted poor country with an established track record of good performance under adjustment programs supported by the IMF and the World Bank commits to additional reforms and a poverty reduction strategy and starts receiving debt relief. • HIPC completion point is the date when a country successfully completes the key structural reforms agreed on at the decision point, including implementing a poverty reduction strategy. The country then receives full debt relief under the HIPC Initiative without further policy conditions. • HIPC Initiative assistance is the debt relief committed as of the decision point (assuming full participation of creditors). Topping-up assistance and assistance provided under the original HIPC Initiative were committed in net present value terms as of the decision point and are converted to end-2008 terms. • MDRI assistance is 100 percent debt relief on eligible debt from IDA, IMF, AfDF, and IDB, delivered in full to countries having reached the HIPC completion point.

Data sources

Data on ODA are from the OECD. Data on goods admitted free of tariffs and average tariffs are from the World Trade Organization, in collaboration with the United Nations Conference on Trade and Development and the International Trade Centre. These data are available at www.mdg-trade. org. Data on subsidies to agriculture are from the OECD's Producer and Consumer Support Estimates, OECD Database 1986-2008, Data on the HIPC Initiative and MDRI are from the World Bank's Economic Policy and Debt Department.

a. Data are for the most recent year available. b. Limited coverage. c. Includes Taiwan, China. d. Data are for 2008. e. Less than 0.5.

Despite much progress in recent decades, gender inequalities remain pervasive in many dimensions of life—worldwide. But while disparities exist throughout the world, they are most prevalent in developing countries. Gender inequalities in the allocation of such resources as education, health care, nutrition, and political voice matter because of the strong association with well-being, productivity, and economic growth. These patterns of inequality begin at an early age, with boys routinely receiving a larger share of education and health spending than do girls, for example.

Because of biological differences girls are expected to experience lower infant and child mortality rates and to have a longer life expectancy than boys. This biological advantage may be overshadowed, however, by gender inequalities in nutrition and medical interventions and by inadequate care during pregnancy and delivery, so that female rates of illness and death sometimes exceed male rates, particularly during early childhood and the reproductive years. In high-income countries women tend to outlive men by four to eight years on average, while in low-income countries the difference is narrower—about two to three years. The difference in child mortality rates (table 2.22) is another good indicator of female social disadvantage because nutrition and medical interventions are particularly important for the 1-4 age group. Female child mortality rates that are as high as or higher than male child mortality rates may indicate discrimination against girls.

Having a child during the teenage years limits girls' opportunities for better education, jobs, and income. Pregnancy is more likely to be unintended during the teenage years, and births are more likely to be premature and are associated with greater risks of complications during delivery and of death. In many countries maternal mortality (tables 1.3 and 2.19) is a leading cause of death among women of reproductive age. Most maternal deaths result from preventable causes—hemorrhage, infection, and complications from unsafe abortions. Prenatal care is essential for recognizing, diagnosing, and promptly treating complications that arise during pregnancy. In high-income countries most women have access to health care during pregnancy, but in developing countries many women suffer pregnancy-related complications, and over half a million die every year (Glasier and others 2006). This is reflected in the differences in maternal mortality ratios between high- and low-income countries.

Women's wage work is important for economic growth and the well-being of families. But women often face such obstacles as restricted access to education and vocational training, heavy workloads at home and in unpaid domestic and market activities, and labor market discrimination. These obstacles force women to limit their participation in paid economic activities. And even when women work. these obstacles cause women to be less productive and to receive lower wages. When women are in paid employment, they tend to be concentrated in the nonagricultural sector. However, in many developing countries women are a large part of agricultural employment, often as unpaid family workers. Among people who are unsalaried, women are more likely than men to be unpaid family workers, while men are more likely than women to be self-employed or employers. There are several reasons for this.

Few women have access to credit markets, capital, land, training, and education, which may be required to start a business. Cultural norms may prevent women from working on their own or from supervising other workers. Also, women may face time constraints due to their traditional family responsibilities. Because of biases and misclassification substantial numbers of employed women may be underestimated or reported as unpaid family workers even when they work in association or equally with their husbands in the family enterprise.

Women are vastly underrepresented in decision-making positions in government, although there is some evidence of recent improvement. Gender parity in parliamentary representation is still far from being realized. In 2009 women accounted for 19 percent of parliamentarians worldwide, compared with 9 percent in 1987. Without representation at this level, it is difficult for women to influence policy.

For information on other aspects of gender, see tables 1.2 (Millennium Development Goals: eradicating poverty and saving lives), 1.3 (Millennium Development Goals: protecting our common environment), 2.3 (Employment by economic activity), 2.4 (Decent work and productive employment), 2.5 (Unemployment), 2.6 (Children at work), 2.10 (Assessing vulnerability and security), 2.13 (Education efficiency), 2.14 (Education completion and outcomes), 2.15 (Education gaps by income and gender), 2.19 (Reproductive health), 2.21 (Health risk factors and future challenges), and 2.22 (Mortality).

Definitions

· Female population is the percentage of the population that is female. • Life expectancy at birth is the number of years a newborn infant would live if prevailing patterns of mortality at the time of its birth were to stay the same throughout its life. • Pregnant women receiving prenatal care are the percentage of women attended at least once during pregnancy by skilled health personnel for reasons related to pregnancy. • Teenage mothers are the percentage of women ages 15-19 who already have children or are currently pregnant. • Women in wage employment in nonagricultural sector are female wage employees in the nonagricultural sector as a percentage of total nonagricultural wage employment. • Unpaid family workers are those who work without pay in a market-oriented establishment or activity operated by a related person living in the same household. · Women in parliaments are the percentage of parliamentary seats in a single or lower chamber held

Data sources

Data on female population are from the United Nations Population Division's World Population Prospects: The 2008 Revision, and data on life expectancy for more than half the countries in the table (most of them developing countries) are from its World Population Prospects: The 2008 Revision, with additional data from census reports, other statistical publications from national statistical offices, Eurostat's Demographic Statistics, the Secretariat of the Pacific Community's Statistics and Demography Programme, and the U.S. Bureau of the Census International Data Base. Data on pregnant women receiving prenatal care are from household surveys, including Demographic and Health Surveys by Macro International and Multiple Indicator Cluster Surveys by the United Nations Children's Fund (UNICEF), and UNICEF's The State of the World's Children 2010. Data on teenage mothers are from Demographic and Health Surveys by Macro International. Data on labor force and employment are from the International Labour Organization's Key Indicators of the Labour Market, 6th edition. Data on women in parliaments are from the Inter-Parliamentary Union.

About the data

The table shows data for 55 economies with populations between 30,000 and 1 million and for smaller economies if they are members of the World Bank. Where data on gross national income (GNI) per capita are not available, the estimated range is given. For more information on the calculation of GNI and purchasing power parity (PPP) conversion factors, see About the data for table 1.1. Additional data for the economies in the table are available on the World Development Indicators CD-ROM or in WDI Online.

Definitions

• Population is based on the de facto definition of population, which counts all residents regardless of legal status or citizenship—except for refugees not permanently settled in the country of asylum, who are generally considered part of the population of their country of origin. The values shown are midyear estimates. For more information, see About the data for table 2.1. • Surface area is a country's total area, including areas under inland bodies of water and some coastal waterways. • Population density is midyear population divided by land area in square kilometers. • Gross national income (GNI), Atlas method, is the sum of value added by all resident producers plus any product taxes (less subsidies) not

included in the valuation of output plus net receipts of primary income (compensation of employees and property income) from abroad. Data are in current U.S. dollars converted using the *World Bank Atlas* method (see *Statistical methods*). • **Purchasing power parity (PPP) GNI** is GNI converted to international dollars using PPP rates. An international dollar has the same purchasing power over GNI that a U.S. dollar has in the United States. • **GNI per capita** is GNI divided by midyear population. • **Gross domestic product (GDP)** is the sum of value added by all resident producers plus any product taxes (less subsidies) not included in the valuation of output. Growth is calculated from constant price GDP data in local

a. Estimated to be upper middle income (\$3,856-\$11,905). b. Based on regression; others are extrapolated from the 2005 International Comparison Program benchmark estimates.

currency. • GDP per capita is GDP divided by midyear population. • Life expectancy at birth is the number of years a newborn infant would live if prevailing patterns of mortality at the time of its birth were to stay the same throughout its life. • Adult literacy rate is the percentage of adults ages 15 and older who can, with understanding, read and write a short, simple statement about their everyday life. • Carbon dioxide emissions are those stemming from the burning of fossil fuels and the manufacture of cement. They include carbon dioxide produced during consumption of solid, liquid, and gas fuels and gas flaring.

Data sources

The indicators here and throughout the book are compiled by World Bank staff from primary and secondary sources. More information about the indicators and their sources can be found in the About the data, Definitions, and Data sources entries that accompany each table in subsequent sections.

c. Estimated to be high income (\$11,906 or more). d. Data are for the area controlled by the government of the Republic of Cyprus. e. Less than 0.5.

chieving the Millennium Development Goals (MDGs) promises a better life for millions: lives saved; women empowered; illiteracy, hunger, and malnutrition reduced or eliminated; and children ensured access to high-quality education and health services. Because the MDGs are so important, countries have been striving to effectively monitor progress toward achieving them. Though the world overall has made progress, many countries remain off track—particularly fragile states and countries emerging from conflict. The global financial crisis could push an estimated 50 million people into poverty, with serious consequences for human development. Poor families cut short their children's schooling, prolonging poverty into the next generation because dropouts earn less as adults. Families are also likely to have to cut back on consumption as recent increases in food prices put pressures on budgets, damaging children's nutrition and health. But the story is not all bleak.

Monitoring the Millennium Development Goals: what do the available data tell us?

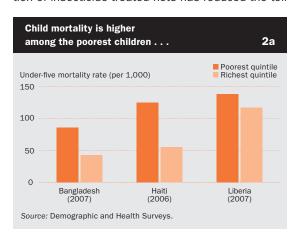

Many countries and regions have made remarkable progress. Deaths of children under age 5 have declined steadily in developing countries, falling from 101 per 1,000 live births in 1990 to 73 in 2008, despite population growth. But many countries have made little progress, especially in Sub-Saharan Africa, and large disparities persist between the richest and poorest children in countries across all regions (figure 2a).

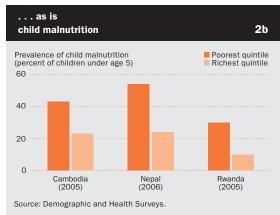

Interventions that could yield breakthroughs for children show mixed success. One child in four in developing countries is underweight—even more in low-income countries (figure 2b). But distribution of insecticide-treated nets has reduced the toll

of malaria—a major killer of children—and higher immunization rates are making advances against measles (United Nations 2009a).

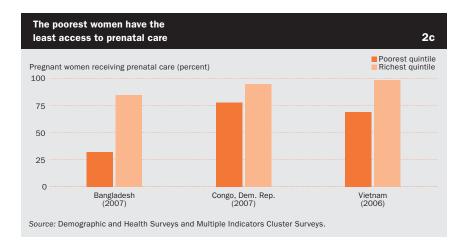

Healthy births continue to be a privilege of the rich. Developed countries report 10 maternal deaths per 100,000 live births, compared with 440 in developing countries—and 14 developing countries have maternal mortality ratios of 1,000 or higher (United Nations 2009a). Interventions to prevent maternal deaths, such as prenatal care, have improved in all regions, but poor women in the world's poorest countries have the least access to them (figure 2c). Access to contraception is increasing in all regions, but unmet need remains high at 11 percent (United Nations 2009a).

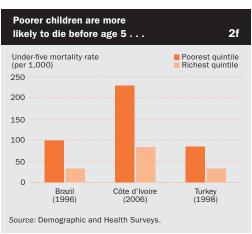

Major accomplishments have also been made in education. Enrollment in primary school reached

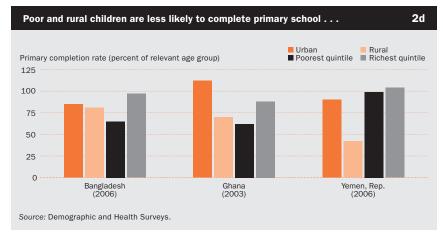

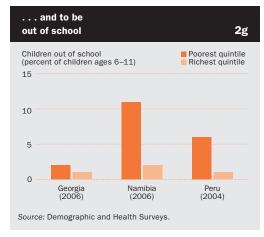

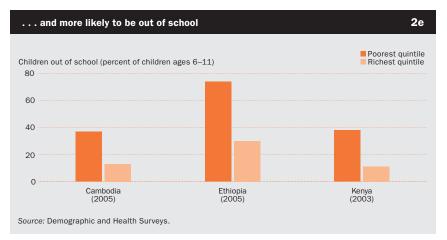

86 percent in developing countries overall in 2007, up from 81 percent in 2000. Most of the progress was in regions lagging furthest behind—Sub-Saharan Africa (up 14 percentage points) and South Asia (up 10 percentage points). Primary school completion rates also improved, from 80 percent in 2000 to 88 percent in 2007, with the greatest improvements in the Middle East and North Africa. But the

improvement was not uniformly distributed: children from poorer households and rural areas are less likely to complete their primary education (figure 2d).

In many countries and regions universal primary education (Millennium Development Goal 2) is jeopardized by the number of children who are out of school. In 2007 an estimated 72 million children were out of school, almost half of them in Sub-Saharan Africa and 18 million of them in South Asia. Nearly half of children out of school have had no contact with formal education. Another 23 percent were previously enrolled but dropped out (United Nations 2009a). Inequalities within countries mean that the poor are most likely to lose out: children from poor households are two to three times as likely to be out of school as their richest counterparts (figure 2e).

And although some of the MDG targets and indicators may be less relevant for many upper middle-income countries, they continue to matter for others. Wide disparities in well-being and achievement between the poorest and the

wealthiest populations persist, impeding countries' ability to meet their targets (figures 2f and 2g). Under-five mortality for richer children is less than half that for poorer children.

Beyond data: what more do countries need to do?

The MDGs continue to provide a focus for country efforts, along with the need to strengthen data collection and analysis to assess progress. At the same time governments need to concentrate on interventions that improve access to quality health and education services that can produce favorable outcomes for the MDGs.

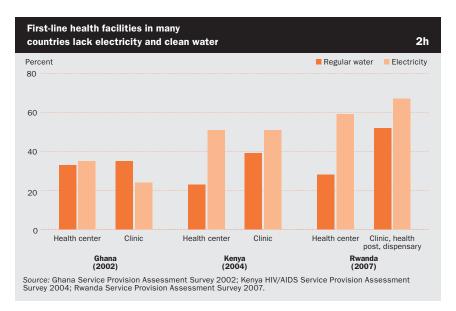

Health

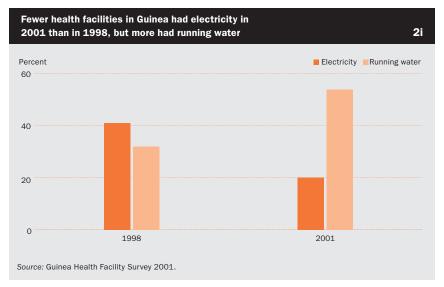

Slow progress on meeting the health MDGs has been associated with disappointing advances in access to health care. Many health systems are not equipped to provide health care for all, reflecting the inability of governments and societies to mobilize the requisite resources and institutions. In particular, countries need to improve three areas of service delivery that focus on people's needs: infrastructure, available staff to deliver services, and adequate and effective funding (Gauthier and others 2009).

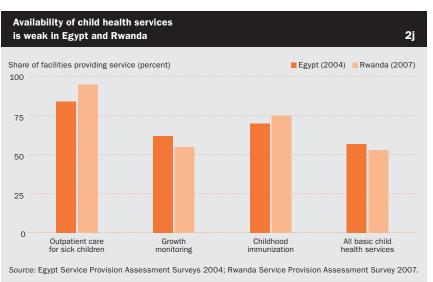

Infrastructure. The quality of health services depends on the availability of basic infrastructure services such as electricity and water. Electricity—limited in many poor countries—is necessary for operating medical equipment and facilities. Because unclean water is an important vector of sickness, clean running water is fundamental to service quality. Yet data indicate that first-line facilities in many countries lack these basic services (figure 2h). And in some countries infrastructure is deteriorating (figure 2i).

The accessibility and quality of health care services are often constrained by the unavailability of basic medical services and equipment (figure 2j). Poor countries often have fewer than 1.1 doctors and 0.9 nurse per 1,000 people, with access unevenly distributed across income groups. Wealthy people are better able to get to well staffed facilities and can afford to be seen by doctors (figure 2k).

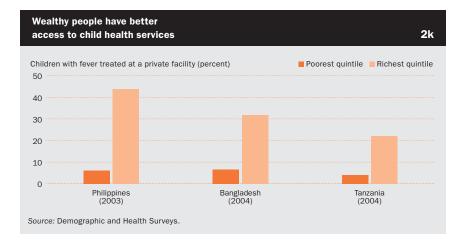

Staffing. In many developing countries staff absenteeism is high, reflecting inadequate incentives and weak local accountability. For example, on an average day 40 percent of primary

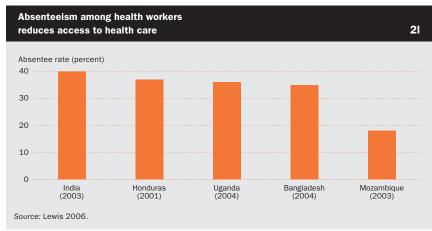

per 100,000 people)				2
Classification	National	Rural	Urban	Ratio of urban to rural
Doctors	6.4	5.2	36.1	6.9
Nurses	41.6	17.7	44.7	2.5
Pharmacists/technicians	1.2	1.1	5.5	5.0
Laboratory technicians	2.7	2.5	7.9	3.2
All health workers	119.8	115.0	234.6	2.0

health care workers in India are not at work (figure 2I). Because most people have to travel far to get to a health center, a high probability that the clinic will not be staffed may discourage patients from seeking care.

Uneven distribution of health workers is a major problem in several countries, especially in rural and poorer areas. For example, Zambia has twice as many health workers in urban areas as in rural areas (table 2m). Distribution of doctors is most uneven—they are seven

times more common in urban areas—followed by pharmacists.

Funding. As a country's income grows, total spending on health care rises. In 2007 highincome economies spent an average of 11 percent of GDP on health services and developing economies 5 percent. Funding for front-line service providers is low in many developing countries because of leakages and allocation rules that favor other purposes. Industrialized countries have shown that the disproportionate focus on hospitals and tertiary care, which dominated practice worldwide for much of the last two decades of the 20th century, has been a major source of inefficiency and inequality. For example, less than 20 percent of doctors in Thailand were specialists 30 years ago; by 2003, 70 percent were (World Health Organization, World Health Report 2008).

Education

In 2002 the World Bank and development partners launched the Education for All Fast Track Initiative, a global partnership to help low-income countries meet the MDG target of universal primary education and the Education for All goal that all children complete a full cycle of primary education by 2015. The initiative encourages countries to design sound education plans and provides additional indicators for tracking progress toward the education MDG, including indicators to monitor infrastructure and capacity at the primary school level, availability and presence in the classroom of qualified teachers, and expenditures on primary education.

At the school. Many schools lack the most basic infrastructure elements that are taken for granted in developed countries (figure 2n). For example, a 2008 survey of primary schools in Asia, Latin America, and North Africa found that more than one student in five in Paraguay, the Philippines, and Sri Lanka was in a school that lacked running water (UNESCO Institute for Statistics 2008b). No country in the survey had a library in every school. In India, Paraguay, Peru, the Philippines, Sri Lanka, and Tunisia, less than half the students were in schools with a telephone.

The survey also showed major gaps in resources between urban and rural schools. In four states of India 27 percent of village schools have electricity while 76 percent of schools in towns and cities do. Only about half these rural

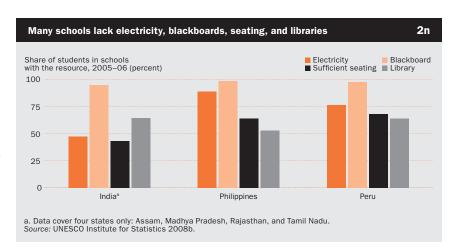

schools have enough toilets for girls, and less than 4 percent have a telephone. In Peru less than half of village schools have electricity, a library, or toilets for boys or girls; nearly all urban schools have electricity, 65 percent have enough lavatories, and 74 percent have libraries.

Teachers. To achieve Education for All goals, few inputs are more essential than having a teacher in the classroom. It is obvious that teacher absence will affect education quality. But teacher absence can also affect education access and school completion rates because poor quality discourages parents from making the sacrifices necessary to send their children to school. More important, high rates of teacher absence often signal deeper problems of accountability and governance that are themselves barriers to educational progress.

How prevalent is the problem of teacher absence? One difficulty in studying teacher absence is that administrative records of teachers' attendance may not be accurate. In countries with the highest absence rates, administrative records may be an especially poor guide to teacher attendance. If poor governance and low levels of accountability undermine teachers' incentives to attend school, those same factors are likely to reduce the accuracy of official attendance records. A study that measured attendance through direct observation of teachers during surprise visits to primary schools in six poor countries in 2002-03 found that teachers were absent about 19 percent of the time on average (Abadzi 2007; figure 2o). On an average day 27 percent of the teachers in Uganda were not at work compared with 5 percent in New York State.

Few teachers face serious threats of being fired for excessive absences. In a survey of 3,000 Indian government schools only one teacher was fired for poor attendance (Abdul Latif Jameel Poverty Action Lab 2009). Even in private schools, where teachers are less protected and schools have financial incentives to provide better service, only 35 of 600 schools reported a teacher being fired for poor attendance.

Funding. Adequate resources are critical for ensuring good quality outcomes in education. Studies have repeatedly stressed the need to ensure adequate and stable funding for education (Bruns, Mingat, and Rakotomalala 2003).

The cost of education

2p

The allocation of public budgets is ultimately the result of competing demands for limited resources. Countries with rising demand for education and limited funding need to keep costs per student low. In 2005 in Sub-Saharan Africa average spending per primary school student was almost 13 percent of per capita GDP, though spending ranged from 4 percent in the Republic of Congo to 35 percent in Burkina Faso. In East Asia and Pacific average spending per primary school student was 15 percent, yet two countries reported the lowest spending levels in the world (Indonesia and Myanmar, at just 3 percent). By contrast, countries in North America and Western Europe tend to spend an average of about 22 percent and those in Central and Eastern Europe around 17 percent.

Source: UNESCO Institute for Statistics, Global Education Digest 2007.

Countries with higher primary gross enrollment ratios and primary completion rates tend to devote a greater share of national income or government budgets to public primary education.

Governments struggle to fund free basic education for all (box 2p). Almost a third of education funding worldwide is allocated to the primary level (\$741 billion, or 1.3 percent of global GDP in purchasing power parity terms; table 2q). Sub-Saharan Africa invests the greatest share (2.1 percent of GDP), followed by the Arab States (1.8 percent) and

Latin America and the Caribbean (1.6 percent). In Burkina Faso, Cambodia, Cameroon, Dominican Republic, and Kenya the share of education funding going to primary education exceeded 60 percent in 2005. These large investments in primary education may reflect efforts to provide basic education to relatively

large school-age populations—or they may indicate that few students pursue higher levels of education.

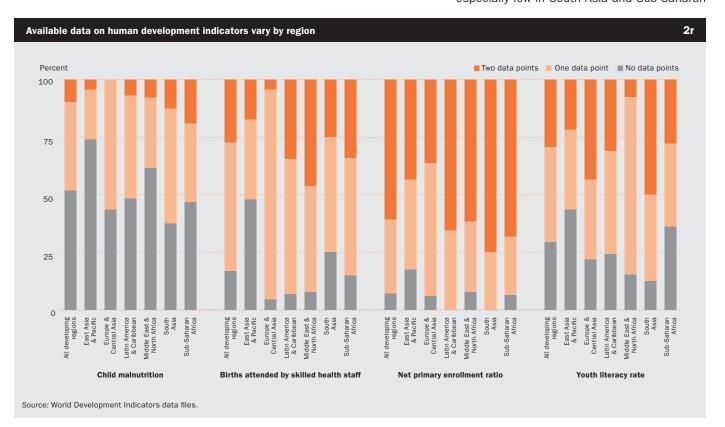

Achievements and gaps in data availability

Attention to the MDGs has been accompanied by substantial increases in the availability of health and education statistics. But data availability remains inadequate in some countries, and some countries still lack sufficient information (two or more data points) to assess progress (figure 2r). Efforts to expand and improve statistical output have benefited from programs to strengthen institutions and individual skills within national statistical systems. Where administrative sources are weak, progress in closing data gaps has been made by mounting household surveys to supplement available data.

One of the most serious gaps is the lack of reliable information on births and deaths in poor countries that lack vital registration systems. On average, only half the births in developing countries were reported from civil registration systems to the United Nations Statistics Division during 2000-07, with coverage especially low in South Asia and Sub-Saharan

Public expenditures on primary education, by r			2
Region	Total expenditure on education (percent of GDP)	Expenditure on primary education (percent of GDP)	Expenditure on primary education as share of total expenditure on education (percent)
Arab states	4.9	1.8	37
Central Asia	2.8	0.6	21
Central and Eastern Europe	4.2	1.1	26
East Asia and Pacific	2.8	1.0	36
Latin America and Caribbean	4.4	1.6	36
North America and Western Europe	5.6	1.5	27
South and West Asia	3.6	1.2	33
Sub-Saharan Africa	4.5	2.1	47
World	4.3	1.3	30

Note: Data are classified by United Nations Education, Scientific, and Cultural Organization regions. Source: UNESCO Institute for Statistics, Global Education Digest 2007.

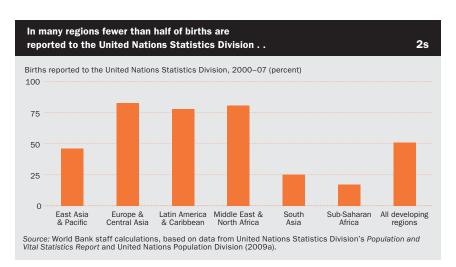

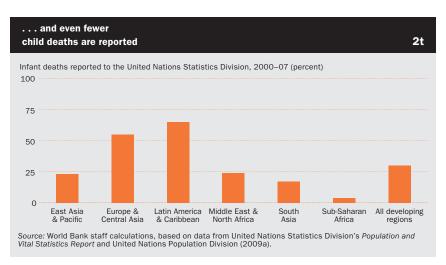

Africa (figure 2s). Reporting of infant deaths is even lower: fewer than a third of infant deaths in developing countries were reported, with low coverage in all regions except Europe and Central Asia and Latin America and the Caribbean (figure 2t).

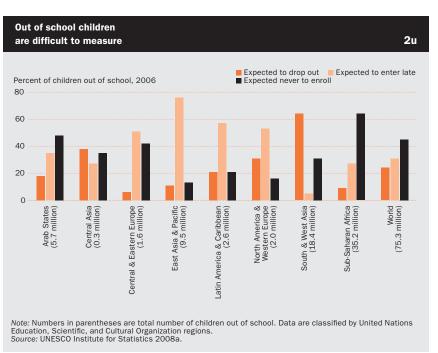

For countries lacking vital registration systems, household surveys and censuses are important sources of fertility and mortality data. The 2010 round of censuses, covering 1996–2014, promises to be far more successful than the previous round. More than 500 million people in 27 countries and areas were not included in the 2000 census round. For 2010 only nine countries have not yet scheduled a census, reducing the number of people not enumerated to about 140 million, a drop of 75 percent from the previous census round.

In education, despite improved reporting of school enrollment and completion rates, difficulties remain in measuring dropouts and out of school children. Many children have had some contact with schooling (figure 2u), but there is still a lack of conceptual clarity in the definitions of the school-age population and school participation. Data from school censuses may overestimate enrollment rates because registered children may not show up or may drop out during the school year. Or the data may undercount students because some students who did not register or officially enroll did attend school. Likewise, household surveys may not use consistent definitions of school attendance or may fail to correct for seasonal variation in attendance.

Another problem is inaccuracies in data for school-age populations (the denominator in calculations of enrollment rates). Different compilers may use different estimates of population size, or ministries of educations may use outdated population estimates. For example, some population estimates or enrollment numbers may include migrants while others exclude them. If the school enrollment data include migrant children while the population estimates exclude them, the resulting enrollment rates will not be accurate. Most critical is the problem of going from sample statistics to estimates for the universe if the sample frame or sample design is not accurate. Censuses, which will become available for virtually all developing countries, remain an important source of information on the age-sex structure of populations.

Beyond the Millennium Development Goals: monitoring emerging challenges

On the whole, people are healthier and better educated than they were 30 years ago, but progress has been deeply unequal. And the nature of some problems is changing at a rate that is wholly unexpected. Thirty years ago about 38 percent of the world's population lived in cities. By 2008 more than 50 percent (3.3 billion people) did. A third of urban dwellers (more than 1 billion people) live in slum areas that lack basic social services. By 2030, 60 percent of the world's population (almost 5 billion people) are projected to live in urban areas, and most of this growth will be concentrated in smaller cities in developing countries and in megacities of unprecedented size in Southern and Eastern Asia (World Health Organization, World Health Report 2008). While health and education outcomes are better in urban areas on average, economic and social stratification perpetuates inequities. These and other emerging challenges will raise demand for types of data different from those routinely collected today by statistical offices—and will call for increased national accountability.

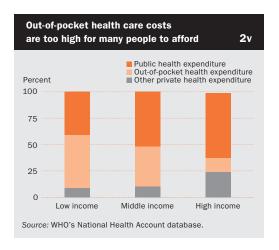

Experience shows that targeted interventions and funding have succeeded in expanding programs to deliver services to those most in need. But achieving the MDGs will also require stronger accountability and a clearer focus on data and statistics, analytic methods for new data collection, improved use of data by national policymakers and planners, and regular evaluations of programs and new initiatives. Achieving the MDGs will also require targeting areas and population groups that have been left behind—rural communities and the poorest households.

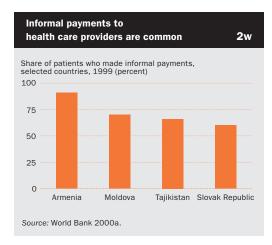

Health

Urbanization, aging populations, and a globalized lifestyle combine to make chronic and noncommunicable diseases, including diabetes, cancers, cardiovascular diseases, and injuries, increasingly important causes of mortality and morbidity in developing countries (World Health Organization, World Health Report 2008). In response, countries need to collect and strengthen statistics on cause of death and move away from fragmented attention to the needs of single-disease programs such as HIV/AIDS.

The increase in noncommunicable diseases, accompanied by a shift in the distribution of death and disease from younger to older people as the population ages, will affect service delivery and the allocation of health budgets. Among the economically and socially deprived populations of poor countries, these changes are most likely to affect children and young adults, especially women. And this rise in chronic, noncommunicable diseases comes on top of an unfinished agenda on communicable diseases and maternal and child health.

In addition to the shifting epidemiological burden of diseases, developing countries, especially low-income countries, continue to struggle with low access to health services. For people in these countries, out-of-pocket expenses make up more than half of health care costs, depriving many families of needed care because they cannot afford it (figure 2v). Also, more than 100 million people worldwide are pushed into poverty each year because of catastrophic health care expenditures (World Health Organization,

World Health Report 2008). Compounding problems of access and equity is weak governance in the delivery of health services. In developing and transition economies, informal payments to health care providers are high (figure 2w).

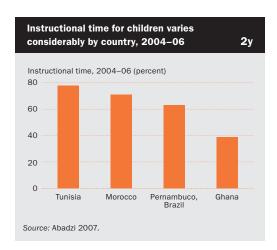

Reliable mortality statistics, the cornerstone of national health information systems, are necessary for assessing population health, planning health policies and health services, and evaluating epidemiological and other health system programs. And the data are essential for monitoring progress toward the health-related MDGs of reducing maternal and child mortality and mortality from HIV/AIDS, tuberculosis, and malaria. Yet in 2007 only 61 percent of developing countries had complete registration systems, and among these only a handful had reliable cause of death statistics. Few efforts have been made to systematically build or strengthen country capacities to collect and use data. The pace needs to quicken.

Education

Achieving universal primary education (Goal 2) is vital to meeting all the other MDGs. The steady increase in primary school enrollment in nearly all regions is an encouraging sign. But countries still need to translate these enrollment rates into opportunities for learning.

Enrollment is not a sufficient measure of learning. Because school attendance is a better predictor of learning outcomes (Abadzi 2007), monitoring of student attendance needs to be strengthened. Many students enrolled on the first day of school do not actually attend during some or part of the year (table 2x). Retaining all enrolled children in school is a challenge for most countries, requiring varied strategies, concerted effort, and investment. And school retention should translate into instructional time for children, so that they can develop cognitive skills and knowledge. Instructional time varies greatly by country (figure 2y), and few countries systematically monitor learning outcomes by assessing student achievement or participating

a. Includes Taiwan, China. b. Excludes the French overseas departments of French Guiana, Guadeloupe, Martinique, and Réunion. c. Increase is due to a surge in the number of migrants since 2004. d. Includes Kosovo.

About the data

Population estimates are usually based on national population censuses, but the frequency and quality vary by country. Most countries conduct a complete enumeration no more than once a decade. Estimates for the years before and after the census are interpolations or extrapolations based on demographic models. Errors and undercounting occur even in high-income countries; in developing countries errors may be substantial because of limits in the transport, communications, and other resources required to conduct and analyze a full census.

The quality and reliability of official demographic data are also affected by public trust in the government, government commitment to full and accurate enumeration, confidentiality and protection against misuse of census data, and census agencies' independence from political influence. Moreover, comparability of population indicators is limited by differences in the concepts, definitions, collection procedures, and estimation methods used by national statistical agencies and other organizations that collect the data.

Of the 155 economies in the table and the 55 economies in table 1.6, 180 (about 86 percent) conducted a census during the 2000 census round (1995–2004). As of March 2010, 61 countries have completed a census for the 2010 census round (2005–14). The currentness of a census and the availability of complementary data from surveys or registration systems are objective ways to judge demographic data quality. Some European countries' registration systems offer complete information on population in the absence of a census. See table 2.17 and *Primary data documentation* for the most recent census or survey year and for the completeness of registration.

Current population estimates for developing countries that lack recent census data and pre- and post-census estimates for countries with census data are provided by the United Nations Population Division and other agencies. The cohort component method—a standard estimation method for estimating and projecting population—requires fertility, mortality, and net migration data, often collected from sample surveys, which can be small or limited in coverage. Population estimates are from demographic modeling and so are susceptible to biases and errors from shortcomings in the model and in the data. Because the five-year age group is the cohort unit and five-year period data are used, interpolations to obtain annual data or single age structure may not reflect actual events or age composition.

The growth rate of the total population conceals age-group differences in growth rates. In many developing countries the once rapidly growing under-15

population is shrinking. Previously high fertility rates and declining mortality rates are now reflected in the larger share of the working-age population.

Dependency ratios capture variations in the proportions of children, elderly people, and working-age people in the population that imply the dependency burden that the working-age population bears in relation to children and the elderly. But dependency ratios show only the age composition of a population, not economic dependency. Some children and elderly people are part of the labor force, and many working-age people are not.

Vital rates are based on data from birth and death registration systems, censuses, and sample surveys by national statistical offices and other organizations, or on demographic analysis. Data for 2008 for most high-income countries are provisional estimates based on vital registers. The estimates for many countries are projections based on extrapolations of levels and trends from earlier years or interpolations of population estimates and projections from the United Nations Population Division.

Vital registers are the preferred source for these data, but in many developing countries systems for registering births and deaths are absent or incomplete because of deficiencies in the coverage of events or geographic areas. Many developing countries carry out special household surveys that ask respondents about recent births and deaths. Estimates derived in this way are subject to sampling errors and recall errors.

The United Nations Statistics Division monitors the completeness of vital registration systems. The share of countries with at least 90 percent complete vital registration rose from 45 percent in 1988 to 61 percent in 2007. Still, some of the most populous developing countries—China, India, Indonesia, Brazil, Pakistan, Bangladesh, Nigeria—lack complete vital registration systems. From 2000 to 2007, on average 64 percent of births, 62 percent of deaths, and 45 percent of infant deaths were registered and reported to the United Nations Statistics Division.

International migration is the only other factor besides birth and death rates that directly determines a country's population growth. From 1990 to 2005 the number of migrants in high-income countries rose 40 million. About 195 million people (3 percent of the world population) live outside their home country. Estimating migration is difficult. At any time many people are located outside their home country as tourists, workers, or refugees or for other reasons. Standards for the duration and purpose of international moves that qualify as migration vary, and estimates require information on flows into and out of countries that is difficult to collect.

Definitions

• Population is based on the de facto definition of population, which counts all residents regardless of legal status or citizenship—except for refugees not permanently settled in the country of asylum, who are generally considered part of the population of their country of origin. The values shown are midyear estimates for 1990 and 2008 and projections for 2015. • Average annual population growth is the exponential change for the period indicated. See Statistical methods for more information. • Population age composition is the percentage of the total population that is in specific age groups. • Dependency ratio is the ratio of dependents-people younger than 15 or older than 64-to the workingage population—those ages 15-64. • Crude death rate and crude birth rate are the number of deaths and the number of live births occurring during the year, per 1,000 people, estimated at midyear. Subtracting the crude death rate from the crude birth rate provides the rate of natural increase, which is equal to the population growth rate in the absence of migration.

Data sources

The World Bank's population estimates are compiled and produced by its Development Data Group in consultation with its Human Development Network, operational staff, and country offices. The United Nations Population Division's World Population Prospects: The 2008 Revision is a source of the demographic data for more than half the countries, most of them developing countries, and the source of data on age composition and dependency ratios for all countries. Other important sources are census reports and other statistical publications from national statistical offices; household surveys conducted by national agencies, Macro International, and the U.S. Centers for Disease Control and Prevention; Eurostat's Demographic Statistics; Secretariat of the Pacific Community, Statistics and Demography Programme; and U.S. Bureau of the Census, International Data Base.

Labor force structure

About the data

The labor force is the supply of labor available for producing goods and services in an economy. It includes people who are currently employed and people who are unemployed but seeking work as well as first-time job-seekers. Not everyone who works is included, however. Unpaid workers, family workers, and students are often omitted, and some countries do not count members of the armed forces. Labor force size tends to vary during the year as seasonal workers enter and leave

Data on the labor force are compiled by the International Labour Organization (ILO) from labor force surveys, censuses, establishment censuses and surveys, and administrative records such as employment exchange registers and unemployment insurance schemes. For some countries a combination of these sources is used. Labor force surveys are the most comprehensive source for internationally comparable labor force data. They can cover all noninstitutionalized civilians, all branches and sectors of the economy, and all categories of workers, including people holding multiple jobs. By contrast, labor force data from population censuses are often based on a limited number of questions on the economic characteristics of individuals, with little scope to probe. The resulting data often differ from labor force survey data and vary considerably by country, depending on the census scope and coverage. Establishment censuses and surveys provide data only on the employed population, not unemployed workers, workers in small establishments, or workers in the informal sector (ILO, Key Indicators of the Labour Market 2001-2002).

The reference period of a census or survey is another important source of differences: in some countries data refer to people's status on the day of the census or survey or during a specific period before the inquiry date, while in others data are recorded without reference to any period. In developing countries, where the household is often the basic unit of production and all members contribute to output, but some at low intensity or irregularly, the estimated labor force may be much smaller than the numbers actually working.

Differing definitions of employment age also affect comparability. For most countries the working age is 15 and older, but in some countries children younger than 15 work full- or part-time and are included in the estimates. Similarly, some countries have an upper age limit. As a result, calculations may systematically over- or underestimate actual rates. For

further information on source, reference period, or definition, consult the original source.

The labor force participation rates in the table are from the ILO's Key Indicators of the Labour Market, 6th edition, database. These harmonized estimates use strict data selection criteria and enhanced methods to ensure comparability across countries and over time, including collection and tabulation methodologies and methods applied to such country-specific factors as military service requirements. Estimates are based mainly on labor force surveys, with other sources (population censuses and nationally reported estimates) used only when no survey data are available.

Participation rates indicate the relative size of the labor supply. Beginning in the 2008 edition of *World Development Indicators*, the indicator covers the population ages 15 and older, to include people who continue working past age 65. In previous editions the indicator was for the population ages 15–64, so participation rates are not comparable across editions.

The labor force estimates in the table were calculated by applying labor force participation rates from the ILO database to World Bank population estimates to create a series consistent with these population estimates. This procedure sometimes results in labor force estimates that differ slightly from those in the ILO's Yearbook of Labour Statistics and its database Key Indicators of the Labour Market.

Estimates of women in the labor force and employment are generally lower than those of men and are not comparable internationally, reflecting that demographic, social, legal, and cultural trends and norms determine whether women's activities are regarded as economic. In many countries many women work on farms or in other family enterprises without pay, and others work in or near their homes, mixing work and family activities during the day.

Definitions

• Labor force participation rate is the proportion of the population ages 15 and older that is economically active: all people who supply labor for the production of goods and services during a specified period. • Total labor force is people ages 15 and older who meet the ILO definition of the economically active population. It includes both the employed and the unemployed. • Average annual percentage growth of the labor force is calculated using the exponential endpoint method (see Statistical methods for more information). • Female labor force as as a percentage of the labor force shows the extent to which women are active in the labor force.

Data sources

Data on labor force participation rates are from the ILO's Key Indicators of the Labour Market, 6th edition, database. Labor force numbers were calculated by World Bank staff, applying labor force participation rates from the ILO database to population estimates.

Note: Data across sectors may not sum to 100 percent because of workers not classified by sector.

a. Data are for the most recent year available. b. Less than 0.5. c. Limited coverage.

Employment by economic activity

About the data

The International Labour Organization (ILO) classifies economic activity using the International Standard Industrial Classification (ISIC) of All Economic Activities, revision 2 (1968) and revision 3 (1990). Because this classification is based on where work is performed (industry) rather than type of work performed (occupation), all of an enterprise's employees are classified under the same industry, regardless of their trade or occupation. The categories should sum to 100 percent. Where they do not, the differences are due to workers who cannot be classified by economic activity.

Data on employment are drawn from labor force surveys, household surveys, official estimates, censuses and administrative records of social insurance schemes, and establishment surveys when no other information is available. The concept of employment generally refers to people above a certain age who worked, or who held a job, during a reference period. Employment data include both full-time and part-time workers.

There are many differences in how countries define and measure employment status, particularly members of the armed forces, self-employed workers, and unpaid family workers. Where members of the armed forces are included, they are allocated to the service sector, causing that sector to be somewhat overstated relative to the service sector in economies where they are excluded. Where data are obtained from establishment surveys, data cover only employees; thus self-employed and unpaid family workers are excluded. In such cases the employment share of the agricultural sector is severely underreported. Caution should be also used where the data refer only to urban areas, which record little or no agricultural work. Moreover, the age group and area covered could differ by country or change over time within a country. For detailed information on breaks in series, consult the original source.

Countries also take different approaches to the treatment of unemployed people. In most countries unemployed people with previous job experience are classified according to their last job. But in some countries the unemployed and people seeking their first job are not classifiable by economic activity. Because of these differences, the size and distribution of employment by economic activity may not be fully comparable across countries.

The ILO's Yearbook of Labour Statistics and its database Key Indicators of the Labour Market report data by major divisions of the ISIC revision 2 or revision 3. In the table the reported divisions or categories are aggregated into three broad groups: agriculture, industry, and services. Such broad classification may obscure fundamental shifts within countries' industrial patterns. A slight majority of countries report economic activity according to the ISIC revision 2 instead of revision 3. The use of one classification or the other should not have a significant impact on the information for the three broad sectors presented in the table.

The distribution of economic wealth in the world remains strongly correlated with employment by economic activity. The wealthier economies are those with the largest share of total employment in services, whereas the poorer economies are largely agriculture based.

The distribution of economic activity by gender reveals some clear patterns. Men still make up the majority of people employed in all three sectors, but the gender gap is biggest in industry. Employment in agriculture is also male-dominated, although not as much as industry. Segregating one sex in a narrow range of occupations significantly reduces economic efficiency by reducing labor market flexibility and thus the economy's ability to adapt to change. This segregation is particularly harmful for women, who have a much narrower range of labor market choices and lower levels of pay than men. But it is also detrimental to men when job losses are concentrated in industries dominated by men and job growth is centered in service occupations, where women have better chances, as has been the recent experience in many countries.

There are several explanations for the rising importance of service jobs for women. Many service jobs—such as nursing and social and clerical work—are considered "feminine" because of a perceived similarity to women's traditional roles. Women often do not receive the training needed to take advantage of changing employment opportunities. And the greater availability of part-time work in service industries may lure more women, although it is unclear whether this is a cause or an effect.

Definitions

• Agriculture corresponds to division 1 (ISIC revision 2) or tabulation categories A and B (ISIC revision 3) and includes hunting, forestry, and fishing.
• Industry corresponds to divisions 2–5 (ISIC revision 2) or tabulation categories C–F (ISIC revision 3) and includes mining and quarrying (including oil production), manufacturing, construction, and public utilities (electricity, gas, and water). • Services correspond to divisions 6–9 (ISIC revision 2) or tabulation categories G–P (ISIC revision 3) and include wholesale and retail trade and restaurants and hotels; transport, storage, and communications; financing, insurance, real estate, and business services; and community, social, and personal services.

Data sources

Data on employment are from the ILO's Key Indicators of the Labour Market, 6th edition, database.

Decent work and productive employment

About the data

Four targets were added to the UN Millennium Declaration at the 2005 World Summit High-Level Plenary Meeting of the 60th Session of the UN General Assembly. One was full and productive employment and decent work for all, which is seen as the main route for people to escape poverty. The four indicators for this target have an economic focus, and three of them are presented in the table.

The employment to population ratio indicates how efficiently an economy provides jobs for people who want to work. A high ratio means that a large proportion of the population is employed. But a lower employment to population ratio can be seen as a positive sign, especially for young people, if it is caused by an increase in their education. This indicator has a gender bias because women who do not consider their work employment or who are not perceived as working tend to be undercounted. This bias has different effects across countries.

Comparability of employment ratios across countries is also affected by variations in definitions of employment and population (see About the data for table 2.3). The biggest difference results from the age range used to define labor force activity. The population base for employment ratios can also vary (see table 2.1). Most countries use the resident, noninstitutionalized population of working age living in private households, which excludes members of the armed forces and individuals residing in mental, penal, or other types of institutions. But some countries include members of the armed forces in the population base of their employment ratio while excluding them from employment data (International Labour Organization, Key Indicators of the Labour Market, 6th edition).

The proportion of unpaid family workers and own-account workers in total employment is derived from information on status in employment. Each status group faces different economic risks, and unpaid family workers and own-account workers are the most vulnerable—and therefore the most likely to fall into poverty. They are the least likely to have formal work arrangements, are the least likely to have social protection and safety nets to guard against economic shocks, and often are incapable of generating sufficient savings to offset these shocks. A high proportion of unpaid family workers in a country indicates weak development, little job growth, and often a large rural economy.

Data on employment by status are drawn from labor force surveys and household surveys, supplemented by official estimates and censuses for a

small group of countries. The labor force survey is the most comprehensive source for internationally comparable employment, but there are still some limitations for comparing data across countries and over time even within a country. Information from labor force surveys is not always consistent in what is included in employment. For example, information provided by the Organisation for Economic Cooperation and Development relates only to civilian employment, which can result in an underestimation of "employees" and "workers not classified by status," especially in countries with large armed forces. While the categories of unpaid family workers and self-employed workers, which include own-account workers, would not be affected, their relative shares would be. Geographic coverage is another factor that can limit cross-country comparisons. The employment by status data for most Latin American countries covers urban areas only. Similarly, in some countries in Sub-Saharan Africa, where limited information is available anyway, the members of producer cooperatives are usually excluded from the self-employed category. For detailed information on definitions and coverage, consult the original source.

Labor productivity is used to assess a country's economic ability to create and sustain decent employment opportunities with fair and equitable remuneration. Productivity increases obtained through investment, trade, technological progress, or changes in work organization can increase social protection and reduce poverty, which in turn reduce vulnerable employment and working poverty. Productivity increases do not guarantee these improvements, but without them-and the economic growth they bring-improvements are highly unlikely. For comparability of individual sectors labor productivity is estimated according to national accounts conventions. However, there are still significant limitations on the availability of reliable data. Information on consistent series of output in both national currencies and purchasing power parity dollars is not easily available, especially in developing countries, because the definition, coverage, and methodology are not always consistent across countries. For example, countries employ different methodologies for estimating the missing values for the nonmarket service sectors and use different definitions of the informal sector.

Definitions

• Employment to population ratio is the proportion of a country's population that is employed. People ages 15 and older are generally considered the working-age population. People ages 15–24 are generally considered the youth population. • Gross enrollment ratio, secondary, is the ratio of total enrollment in secondary education, regardless of age, to the population of the age group that officially corresponds to secondary education. • Vulnerable employment is unpaid family workers and own-account workers as a percentage of total employment. • Labor productivity is the growth rate of gross domestic product (GDP) divided by total employment in the economy.

Data sources

Data on employment to population ratio, vulnerable employment, and labor productivity are from the International Labour Organization's Key Indicators of the Labour Market, 6th edition, database. Data on gross enrollment ratios are from the United Nations Educational, Scientific, and Cultural Organization Institute for Statistics.

a. Data are for the most recent year available. b. Limited coverage.

About the data

Unemployment and total employment are the broadest indicators of economic activity as reflected by the labor market. The International Labour Organization (ILO) defines the unemployed as members of the economically active population who are without work but available for and seeking work, including people who have lost their jobs or who have voluntarily left work. Some unemployment is unavoidable. At any time some workers are temporarily unemployed—between jobs as employers look for the right workers and workers search for better jobs. Such unemployment, often called frictional unemployment, results from the normal operation of labor markets.

Changes in unemployment over time may reflect changes in the demand for and supply of labor; they may also reflect changes in reporting practices. Paradoxically, low unemployment rates can disguise substantial poverty in a country, while high unemployment rates can occur in countries with a high level of economic development and low rates of poverty. In countries without unemployment or welfare benefits people eke out a living in vulnerable employment. In countries with well developed safety nets workers can afford to wait for suitable or desirable jobs. But high and sustained unemployment indicates serious inefficiencies in resource allocation.

The ILO definition of unemployment notwithstanding, reference periods, the criteria for people considered to be seeking work, and the treatment of people temporarily laid off or seeking work for the first time vary across countries. In many developing countries it is especially difficult to measure employment and unemployment in agriculture. The timing of a survey, for example, can maximize the effects of seasonal unemployment in agriculture. And informal sector employment is difficult to quantify where informal activities are not tracked.

Data on unemployment are drawn from labor force sample surveys and general household sample surveys, censuses, and official estimates, which are generally based on information from different sources and can be combined in many ways. Administrative records, such as social insurance statistics and employment office statistics, are not included in the table because of their limitations in coverage. Labor force surveys generally yield the most comprehensive data because they include groups not covered in other unemployment statistics, particularly people seeking work for the first time. These surveys generally use a definition of unemployment that follows the international recommendations more closely than that used by other sources and therefore

generate statistics that are more comparable internationally. But the age group, geographic coverage, and collection methods could differ by country or change over time within a country. For detailed information, consult the original source.

Women tend to be excluded from the unemployment count for various reasons. Women suffer more from discrimination and from structural, social, and cultural barriers that impede them from seeking work. Also, women are often responsible for the care of children and the elderly and for household affairs. They may not be available for work during the short reference period, as they need to make arrangements before starting work. Furthermore, women are considered to be employed when they are working part-time or in temporary jobs, despite the instability of these jobs or their active search for more secure employment.

Long-term unemployment is measured by the length of time that an unemployed person has been without work and looking for a job. The data in the table are from labor force surveys. The underlying assumption is that shorter periods of joblessness are of less concern, especially when the unemployed are covered by unemployment benefits or similar forms of support. The length of time that a person has been unemployed is difficult to measure, because the ability to recall that time diminishes as the period of joblessness extends. Women's long-term unemployment is likely to be lower in countries where women constitute a large share of the unpaid family workforce.

Unemployment by level of educational attainment provides insights into the relation between the educational attainment of workers and unemployment and may be used to draw inferences about changes in employment demand. Information on educational attainment is the best available indicator of skill levels of the labor force. Besides the limitations to comparability raised for measuring unemployment, the different ways of classifying the education level may also cause inconsistency. Education level is supposed to be classified according to International Standard Classification of Education 1997 (ISCED97). For more information on ISCED97, see About the data for table 2.11.

Definitions

• Unemployment is the share of the labor force without work but available for and seeking employment. Definitions of labor force and unemployment may differ by country (see About the data). • Long-term unemployment is the number of people with continuous periods of unemployment extending for a year or longer, expressed as a percentage of the total unemployed. • Unemployment by educational attainment is the unemployed by level of educational attainment as a percentage of the total unemployed. The levels of educational attainment accord with the ISCED97 of the United Nations Educational, Scientific, and Cultural Organization.

Data sources

Data on unemployment are from the ILO's Key Indicators of the Labour Market, 6th edition, database.

a. Shares may not sum to 100 percent because of a residual category not included in the table. b. Covers only Angola-secured territory. c. Covers children ages 10–14. d. Refers to family workers, regardless of whether they are paid. e. Refers to unpaid workers, regardless of whether they are family workers. f. Covers northern Sudan only. g. Includes workers who are selfemployed in the nonagricultural sector and workers who are working on their own or family farm or shamba. h. Covers children ages 6–14.

About the data

The data in the table refer to children's work in the sense of "economic activity"—that is, children in employment, a broader concept than child labor (see ILO 2009a for details on this distinction).

In line with the definition of economic activity adopted by the 13th International Conference of Labour Statisticians, the threshold for classifying a person as employed is to have been engaged at least one hour in any activity during the reference period relating to the production of goods and services set by the 1993 UN System of National Accounts. Children seeking work are thus excluded. Economic activity covers all market production and certain nonmarket production, including production of goods for own use. It excludes unpaid household services (commonly called "household chores")—that is, the production of domestic and personal services by household members for own-household consumption.

Data are from household surveys conducted by the International Labor Organization (ILO), the United Nations Children's Fund (UNICEF), the World Bank, and national statistical offices. The surveys yield data on education, employment, health, expenditure, and consumption indicators related to children's work

Household survey data generally include information on work type—for example, whether a child is working for payment in cash or in kind or is involved in unpaid work, working for someone who is not a member of the household, or involved in any type of family work (on the farm or in a business). Country surveys define the ages for child labor as 5–17. The

data in the table have been recalculated to present statistics for children ages 7–14.

Although efforts are made to harmonize the definition of employment and the questions on employment in survey questionnaires, significant differences remain in the survey instruments that collect data on children in employment and in the sampling design underlying the surveys. Differences exist not only across different household surveys in the same country but also across the same type of survey carried out in different countries, so estimates of working children are not fully comparable across countries.

The table aggregates the distribution of children in employment by the industrial categories of the International Standard Industrial Classification (ISIC): agriculture, manufacturing, and services. A residual category—which includes mining and quarrying; electricity, gas, and water; construction; extraterritorial organization; and other inadequately defined activities—is not presented. Both ISIC revision 2 and revision 3 are used, depending on the country's codification for describing economic activity. This does not affect the definition of the groups in the table.

The table also aggregates the distribution of children in employment by status in employment, based on the International Classification of Status in Employment (1993), which shows the distribution in employment by three major categories: self-employed workers, wage workers (also known as employees), and unpaid family workers. A residual category—which includes those not classifiable by status—is not presented.

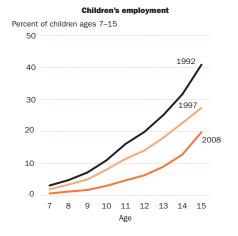

Definitions

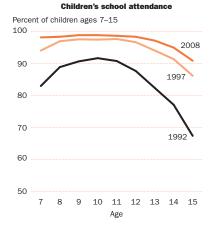

· Survey year is the year in which the underlying data were collected. • Children in employment are children involved in any economic activity for at least one hour in the reference week of the survey. • Work only refers to children who are employed and not attending school. • Study and work refer to children attending school in combination with employment. • Employment by economic activity is the distribution of children in employment by the major industrial categories (ISIC revision 2 or revision 3). • Agriculture corresponds to division 1 (ISIC revision 2) or categories A and B (ISIC revision 3) and includes agriculture and hunting, forestry and logging, and fishing. • Manufacturing corresponds to division 3 (ISIC revision 2) or category D (ISIC revision 3). • Services correspond to divisions 6-9 (ISIC revision 2) or categories G-P (ISIC revision 3) and include wholesale and retail trade, hotels and restaurants, transport, financial intermediation, real estate. public administration, education, health and social work, other community services, and private household activity. • Self-employed workers are people whose remuneration depends directly on the profits derived from the goods and services they produce, with or without other employees, and include employers, own-account workers, and members of producers cooperatives. • Wage workers (also known as employees) are people who hold explicit (written or oral) or implicit employment contracts that provide basic remuneration that does not depend directly on the revenue of the unit for which they work. • Unpaid family workers are people who work without pay in a market-oriented establishment operated by a related person living in the same household.

Data sources

Data on children at work are estimates produced by the Understanding Children's Work project based on household survey data sets made available by the ILO's International Programme on the Elimination of Child Labour under its Statistical Monitoring Programme on Child Labour, UNICEF under its Multiple Indicator Cluster Survey program, the World Bank under its Living Standards Measurement Study program, and national statistical offices. Information on how the data were collected and some indication of their reliability can be found at www.ilo.org/public/english/standards/ipec/simpoc/, www.childinfo.org, and www.worldbank.org/lsms. Detailed country statistics can be found at www.ucw-project.org.

a. Data are from national sources. b. Data refer to share of households rather than share of population. c. Covers Asunción metropolitan area only.

Poverty rates at national poverty lines

About the data

The World Bank periodically prepares poverty assessments of countries in which it has an active program, in close collaboration with national institutions, other development agencies, and civil society groups, including poor people's organizations. Poverty assessments report the extent and causes of poverty and propose strategies to reduce it. Since 1992 the World Bank has conducted about 200 poverty assessments, which are the main source of the poverty estimates presented in the table. Countries report similar assessments as part of their Poverty Reduction Strategies.

The poverty assessments are the best available source of information on poverty estimates using national poverty lines. They often include separate assessments of urban and rural poverty. Data are derived from nationally representative household surveys conducted by national statistical offices or by private agencies under the supervision of government or international agencies and obtained from government statistical offices and World Bank Group country departments.

Some poverty assessments analyze the current poverty status of a country using the latest available household survey data, while others use survey data for several years to analyze poverty trends. Thus, poverty estimates for more than one year might be derived from a single poverty assessment. A poverty assessment might not use all available household surveys, or survey data might become available at a later date even though data were collected before the poverty assessment date. Thus poverty assessments may not fully represent all household survey data.

Many developing countries, particularly middleincome countries, have their own poverty monitoring programs with well documented estimation methodologies. The programs regularly publish what the countries consider official poverty estimates. Such estimates are reviewed by World Bank researchers and included in the table.

Data availability

The number of data sets within two years of any given year rose dramatically, from 13 between 1978 and 1982 to 158 between 2001 and 2006. Data coverage is improving in all regions, but the Middle East and North Africa and Sub-Saharan Africa continue to lag. The database, maintained by a team in the World Bank's Development Research Group, is updated annually as new survey data become available, and a major reassessment of progress against poverty is

made about every three years. A complete overview of data availability by year and country is available at http://iresearch.worldbank.org/povcalnet/.

Poverty assessments are based on surveys fielded to collect, among other things, information on income or consumption from a sample of households. To be useful for poverty estimates, surveys must be nationally representative and include sufficient information to compute a comprehensive estimate of total household consumption or income (including consumption or income from own production), from which it is possible to construct a correctly weighted distribution of consumption or income per person. There remain many potential problems with household survey data, including selective nonresponse and differences in the menu of consumption items presented and the length of the period over which respondents must recall their expenditures. These issues are discussed in About the data for table 2.8.

National poverty lines

National poverty lines are used to make estimates of poverty consistent with the country's specific economic and social circumstances and are not intended for international comparisons of poverty rates. The setting of national poverty lines reflects local perceptions of the level of consumption or income needed not to be poor. The perceived boundary between poor and not poor rises with the average income of a country and so does not provide a uniform measure for comparing poverty rates across countries. Nevertheless, national poverty estimates are clearly the appropriate measure for setting national policies for poverty reduction and for monitoring their results.

Almost all the national poverty lines use a food bundle based on prevailing diets that attains predetermined nutritional requirements for good health and normal activity levels, plus an allowance for nonfood spending. The rise in poverty lines with average income is driven more by the gradient in the nonfood component of the poverty lines than in the food component, although there is still an appreciable share attributable to the gradient in food poverty lines. While nutritional requirements tend to be fairly similar even across countries at different levels of economic development, richer countries tend to use a more expensive food bundle—more meat and vegetables, less starchy staples, and more processed foods generally—for attaining the same nutritional

Definitions

• Survey year is the year in which the underlying data were collected. • Rural population below national poverty line is the percentage of the rural population living below the national rural poverty line. • Urban population below national poverty line is the percentage of the urban population living below the national urban poverty line. • National population below national poverty line is the percentage of the country's population living below the national poverty line. National estimates are based on populationweighted subgroup estimates from household surveys. • Poverty gap at national poverty line is the mean shortfall from the poverty line (counting the nonpoor as having zero shortfall) as a percentage of the poverty line. This measure reflects the depth of poverty as well as its incidence.

Data sources

The poverty measures are prepared by the World Bank's Development Research Group, based on data from World Bank's country poverty assessments and country Poverty Reduction Strategies. Summaries of poverty assessments are available at www.worldbank.org/povertynet, by selecting "Poverty assessments" from the left side bar. Poverty assessment documents are available at www-wds.worldbank.org, under "By topic," "Poverty reduction," "Poverty assessment." Further discussion of how national poverty lines vary across countries can be found in Ravallion. Chen. and Sangraula's "Dollar a Day Revisited" (2008).

a. Expenditure based. b. In purchasing power parity (PPP) dollars imputed using regression. c. Covers urban areas only. d. Income based. e. Adjusted by spatial consumer price index information. f. PPP conversion factor based on urban prices. g. Weighted average of urban and rural estimates. h. Weighted average of urban and rural poverty lines. i. Due to change in survey design, the most recent survey is not strictly comparable with the previous one.

Regional poverty estimates and progress toward the Millennium Development Goals

Global poverty measured at the \$1.25 a day poverty line has been decreasing since the 1980s. The share of population living on less than \$1.25 a day fell 10 percentage points, to 42 percent, in 1990 and then fell nearly 17 percentage points between 1990 and 2005. The number of people living in extreme poverty fell from 1.9 billion in 1981 to 1.8 billion in 1990 to about 1.4 billion in 2005 (figure 2.8a). This substantial reduction in extreme poverty over the past quarter century, however, disguises large regional differences.

The greatest reduction in poverty occurred in East Asia and Pacific, where the poverty rate declined from 78 percent in 1981 to 17 percent in 2005 and the number of people living on less than \$1.25 a day dropped more than 750 million (figure 2.8b). Much of this decline was in China, where poverty fell from

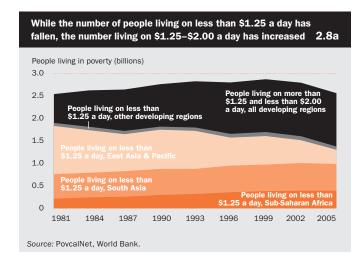

84 percent to 16 percent, leaving 620 million fewer people in poverty.

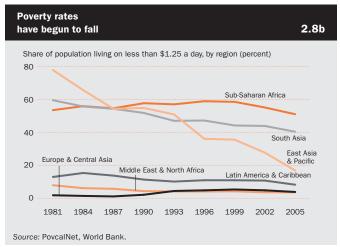

Over the same period the poverty rate in South Asia fell from 59 percent to 40 percent (table 2.8c). In contrast, the poverty rate fell only slightly in Sub-Saharan Africa—from less than 54 percent in 1981 to more than 58 percent in 1999 then down to 51 percent in 2005. But the number of people living below the poverty line has nearly doubled.

Only East Asia and Pacific is consistently on track to meet the Millennium Development Goal target of reducing 1990 poverty rates by half by 2015. A slight acceleration over historical growth rates could lift Latin America and the Caribbean and South Asia to the target. However, the recent slowdown in the global economy may leave these regions and many countries short of the target. Preliminary estimates for 2009 suggest that lower economic growth rates will likely leave 50 million more people below the

\$1.25 a day poverty line than had been expected before the crisis.

Most of the people who have escaped extreme poverty remain very poor by the standards of middle-income economies. The median poverty line for developing countries in 2005 was \$2.00 a day. The poverty rate for all developing countries measured at this line fell from nearly 70 percent in 1981 to 47 percent in 2005, but the number of people living on less than \$2.00 a day has remained nearly constant at 2.5 billion. The largest decrease, both in number and proportion, occurred in East Asia and Pacific, led by China. Elsewhere, the number of people living on less than \$2.00 a day increased, and the number of people living between \$1.25 and \$2.00 a day nearly doubled, to 1.2 billion. In 2009 the global growth deceleration will likely leave 57 million more people below the \$2 a day poverty line.

Poverty rates at international poverty lines

About the data

The World Bank produced its first global poverty estimates for developing countries for *World Development Report* 1990: *Poverty* using household survey data for 22 countries (Ravallion, Datt, and van de Walle 1991). Since then there has been considerable expansion in the number of countries that field household income and expenditure surveys. The World Bank's poverty monitoring database now includes more than 600 surveys representing 115 developing countries. More than 1.2 million randomly sampled households were interviewed in these surveys, representing 96 percent of the population of developing countries.

Data availability

The number of data sets within two years of any given year rose dramatically, from 13 between 1978 and 1982 to 158 between 2001 and 2006. Data coverage is improving in all regions, but the Middle East and North Africa and Sub-Saharan Africa continue to lag. The database, maintained by a team in the World Bank's Development Research Group, is updated annually as new survey data become available, and a major reassessment of progress against poverty is made about every three years. A complete overview of data availability by year and country is available at http://iresearch.worldbank.org/povcalnet/.

Data quality

Besides the frequency and timeliness of survey data, other data quality issues arise in measuring household living standards. The surveys ask detailed questions on sources of income and how it was spent, which must be carefully recorded by trained personnel. Income is generally more difficult to measure accurately, and consumption comes closer to the notion of living standards. And income can vary over time even if living standards do not. But consumption data are not always available: the latest estimates reported here use consumption for about two-thirds of countries.

However, even similar surveys may not be strictly comparable because of differences in timing or in the quality and training of enumerators. Comparisons of countries at different levels of development also pose a potential problem because of differences in the relative importance of the consumption of nonmarket goods. The local market value of all consumption in kind (including own production, particularly important in underdeveloped rural economies) should be included in total consumption expenditure, but may not be. Most survey data now include valuations for consumption or income from own production, but valuation methods vary.

The statistics reported here are based on consumption data or, when unavailable, on income surveys. Analysis of some 20 countries for which income and consumption expenditure data were both available from the same surveys found income to yield a higher mean than consumption but also higher inequality. When poverty measures based on consumption and income were compared, the two effects roughly cancelled each other out: there was no significant statistical difference.

International poverty lines

International comparisons of poverty estimates entail both conceptual and practical problems. Countries have different definitions of poverty, and consistent comparisons across countries can be difficult. Local poverty lines tend to have higher purchasing power in rich countries, where more generous standards are used, than in poor countries.

Poverty measures based on an international poverty line attempt to hold the real value of the poverty line constant across countries, as is done when making comparisons over time. Since World Development Report 1990 the World Bank has aimed to apply a common standard in measuring extreme poverty, anchored to what poverty means in the world's poorest countries. The welfare of people living in different countries can be measured on a common scale by adjusting for differences in the purchasing power of currencies. The commonly used \$1 a day standard, measured in 1985 international prices and adjusted to local currency using purchasing power parities (PPPs), was chosen for World Development Report 1990 because it was typical of the poverty lines in low-income countries at the time.

Early editions of World Development Indicators used PPPs from the Penn World Tables to convert values in local currency to equivalent purchasing power measured in U.S dollars. Later editions used 1993 consumption PPP estimates produced by the World Bank. International poverty lines were recently revised using the new data on PPPs compiled in the 2005 round of the International Comparison Program, along with data from an expanded set of household income and expenditure surveys. The new extreme poverty line is set at \$1.25 a day in 2005 PPP terms, which represents the mean of the poverty lines found in the poorest 15 countries ranked by per capita consumption. The new poverty line maintains the same standard for extreme poverty—the poverty line typical of the poorest countries in the world—but updates it using the latest information on the cost of living in developing countries.

PPP exchange rates are used to estimate global poverty, because they take into account the local prices of goods and services not traded internationally. But PPP rates were designed for comparing aggregates from national accounts, not for making international poverty comparisons. As a result, there is no certainty that an international poverty line measures the same degree of need or deprivation across countries. So-called poverty PPPs, designed to compare the consumption of the poorest people in the world, might provide a better basis for comparison of poverty across countries. Work on these measures is ongoing.

Definitions

• International poverty line in local currency is the international poverty lines of \$1.25 and \$2.00 a day in 2005 prices, converted to local currency using the PPP conversion factors estimated by the International Comparison Program. • Survey year is the year in which the underlying data were collected. • Population below \$1.25 a day and population below \$2 a day are the percentages of the population living on less than \$1.25 a day and \$2.00 a day at 2005 international prices. As a result of revisions in PPP exchange rates, poverty rates for individual countries cannot be compared with poverty rates reported in earlier editions. • Poverty gap is the mean shortfall from the poverty line (counting the nonpoor as having zero shortfall), expressed as a percentage of the poverty line. This measure reflects the depth of poverty as well as its incidence.

Data sources

The poverty measures are prepared by the World Bank's Development Research Group. The international poverty lines are based on nationally representative primary household surveys conducted by national statistical offices or by private agencies under the supervision of government or international agencies and obtained from government statistical offices and World Bank Group country departments. The World Bank Group has prepared an annual review of its poverty work since 1993. For details on data sources and methods used in deriving the World Bank's latest estimates, and further discussion of the results, see Shaohua Chen and Martin Ravallion's "The Developing World Is Poorer Than We Thought, but No Less Successful in the Fight against Poverty?" (2008).

a. Percentage shares by quintile may not sum to 100 percent because of rounding. b. Refers to expenditure shares by percentiles of population, ranked by per capita expenditure. c. Urban data. d. Refers to income shares by percentiles of population, ranked by per capita income.

Distribution of income or consumption

About the data

Inequality in the distribution of income is reflected in the percentage shares of income or consumption accruing to portions of the population ranked by income or consumption levels. The portions ranked lowest by personal income receive the smallest shares of total income. The Gini index provides a convenient summary measure of the degree of inequality. Data on the distribution of income or consumption come from nationally representative household surveys. Where the original data from the household survey were available, they have been used to directly calculate the income or consumption shares by quintile. Otherwise, shares have been estimated from the best available grouped data.

The distribution data have been adjusted for household size, providing a more consistent measure of per capita income or consumption. No adjustment has been made for spatial differences in cost of living within countries, because the data needed for such calculations are generally unavailable. For further details on the estimation method for low- and middle-income economies, see Ravallion and Chen (1996).

Because the underlying household surveys differ in method and type of data collected, the distribution data are not strictly comparable across countries. These problems are diminishing as survey methods improve and become more standardized, but achieving strict comparability is still impossible (see *About the data* for tables 2.7 and 2.8).

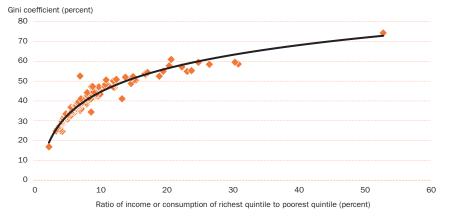

Two sources of noncomparability should be noted in particular. First, the surveys can differ in many respects, including whether they use income or consumption expenditure as the living standard indicator. The distribution of income is typically more unequal than the distribution of consumption. In addition, the definitions of income used differ more often among surveys. Consumption is usually a much better welfare indicator, particularly in developing countries. Second, households differ in size (number of members) and in the extent of income sharing among members. And individuals differ in age and consumption needs. Differences among countries in these respects may bias comparisons of distribution.

World Bank staff have made an effort to ensure that the data are as comparable as possible. Wherever possible, consumption has been used rather than income. Income distribution and Gini indexes for high-income economies are calculated directly from the Luxembourg Income Study database, using an estimation method consistent with that applied for developing countries.

Definitions

. Survey year is the year in which the underlying data were collected. . Gini index measures the extent to which the distribution of income (or consumption expenditure) among individuals or households within an economy deviates from a perfectly equal distribution. A Lorenz curve plots the cumulative percentages of total income received against the cumulative number of recipients, starting with the poorest individual. The Gini index measures the area between the Lorenz curve and a hypothetical line of absolute equality, expressed as a percentage of the maximum area under the line. Thus a Gini index of 0 represents perfect equality, while an index of 100 implies perfect inequality. • Percentage share of income or consumption is the share of total income or consumption that accrues to subgroups of population indicated by deciles or quintiles.

The Gini coefficient and ratio of income or consumption of the richest quintile to the poorest quintiles are closely correlated 2.9a

There are many ways to measure income or consumption inequality. The Gini coefficient shows inequality over the entire population; the ratio of income or consumption of the richest quintile to the poorest quintiles shows differences only at the tails of the population distribution. Both measures are closely correlated and provide similar information. At low levels of inequality the Gini coefficient is a more sensitive measure, but above a Gini value of 45–55 percent the inequality ratio rises faster.

Source: World Development Indicators data files.

Data sources

Data on distribution are compiled by the World Bank's Development Research Group using primary household survey data obtained from government statistical agencies and World Bank country departments. Data for high-income economies are from the Luxembourg Income Study database.

a. Data are for the most recent year available. b. Limited coverage. c. Includes expenditure on old-age and survivors benefits only. d. Includes old-age, survivors, disability, military, and work accident or disease pensions. e. Includes Montenegro.

Assessing vulnerability and security

About the data

As traditionally measured, poverty is a static concept, and vulnerability a dynamic one. Vulnerability reflects a household's resilience in the face of shocks and the likelihood that a shock will lead to a decline in well-being. Thus, it depends primarily on the household's assets and insurance mechanisms. Because poor people have fewer assets and less diversified sources of income than do the better-off, fluctuations in income affect them more.

Enhancing security for poor people means reducing their vulnerability to such risks as ill health, providing them the means to manage risk themselves, and strengthening market or public institutions for managing risk. Tools include microfinance programs, public provision of education and basic health care, and old age assistance (see tables 2.11 and 2.16).

Poor households face many risks, and vulnerability is thus multidimensional. The indicators in the table focus on individual risks—youth unemployment, female-headed households, income insecurity in old age—and the extent to which publicly provided services may be capable of mitigating some of these risks. Poor people face labor market risks, often having to take up precarious, low-quality jobs and to increase their household's labor market participation by sending their children to work (see tables 2.4 and 2.6). Income security is a prime concern for the elderly.

Youth unemployment is an important policy issue for many economies. Experiencing unemployment may permanently impair a young person's productive potential and future employment opportunities. The table presents unemployment among youth ages 15-24, but the lower age limit for young people in a country could be determined by the minimum age for leaving school, so age groups could differ across countries. Also, since this age group is likely to include school leavers, the level of youth unemployment varies considerably over the year as a result of different school opening and closing dates. The youth unemployment rate shares similar limitations on comparability as the general unemployment rate. For further information, see About the data for table 2.5 and the original source.

The definition of female-headed household differs greatly across countries, making cross-country comparison difficult. In some cases it is assumed that a woman cannot be the head of any household with an adult male, because of sex-biased stereotype. Caution should be used in interpreting the data.

Pension scheme coverage may be broad or even universal where eligibility is determined by citizenship,

residency, or income status. In contribution-related schemes, however, eligibility is usually restricted to individuals who have contributed for a minimum number of years. Definitional issues—relating to the labor force, for example—may arise in comparing coverage by contribution-related schemes over time and across countries (for country-specific information, see Hinz and others forthcoming). The share of the labor force covered by a pension scheme may be overstated in countries that do not try to count informal sector workers as part of the labor force.

Public interventions and institutions can provide services directly to poor people, although whether these interventions and institutions work well for the poor is debated. State action is often ineffective, in part because governments can influence only a few of the many sources of well-being and in part because of difficulties in delivering goods and services. The effectiveness of public provision is further constrained by the fiscal resources at governments' disposal and the fact that state institutions may not be responsive to the needs of poor people.

The data on public pension spending cover the pension programs of the social insurance schemes for which contributions had previously been made. In many cases noncontributory pensions or social assistance targeted to the elderly and disabled are also included. A country's pattern of spending is correlated with its demographic structure—spending increases as the population ages.

Definitions

- Youth unemployment is the share of the labor force ages 15–24 without work but available for and seeking employment.
 Female-headed households are the percentage of households with a female head.
- Pension contributors are the share of the labor force or working-age population (here defined as ages 15 and older) covered by a pension scheme.
- Public expenditure on pensions is all government expenditures on cash transfers to the elderly, the disabled, and survivors and the administrative costs of these programs. Average pension is the average pension payment of all pensioners of the main pension schemes (including old-age, survivors, disability, military, and work accident or disease pensions) divided by the average wage of all formal sector workers.

Data sources

Data on youth unemployment are from the ILO's Key Indicators of the Labour Market, 6th edition, database. Data on female-headed household are from Demographic and Health Surveys by Macro International. Data on pension contributors and pension spending are from Hinz and others' "International Patterns of Pension Provision II" (forthcoming).

a. Provisional data. b. Data are for 2009.

About the data

Data on education are compiled by the United Nations Educational, Scientific, and Cultural Organization (UNESCO) Institute for Statistics from official responses to surveys and from reports provided by education authorities in each country. The data are used for monitoring, policymaking, and resource allocation. However, coverage and data collection methods vary across countries and over time within countries, so comparisons should be made with caution.

For most countries the data on education spending in the table refer to public spending—government spending on public education plus subsidies for private education—and generally exclude foreign aid for education. They may also exclude spending by religious schools, which play a significant role in many developing countries. Data for some countries and some years refer to ministry of education spending only and exclude education expenditures by other ministries and local authorities.

Many developing countries seek to supplement public funds for education, some with tuition fees to recover part of the cost of providing education services or to encourage development of private schools. Fees raise difficult questions of equity, efficiency, access, and taxation, however, and some governments have used scholarships, vouchers, and other public finance methods to counter criticism. For greater detail, consult the country- and indicatorspecific notes in the original source.

The share of public expenditure devoted to education allows an assessment of the priority a government assigns to education relative to other public investments, as well as a government's commitment to investing in human capital development. It also reflects the development status of a country's education system relative to that of others. However, returns on investment to education, especially primary and lower secondary education, cannot be understood simply by comparing current education indicators with national income. It takes a long time before currently enrolled children can productively contribute to the national economy (Hanushek 2002).

Data on education finance are generally of poor quality. This is partly because ministries of education, from which the UNESCO Institute for Statistics collects data, may not be the best source for education finance data. Other agencies, particularly ministries of finance, need to be consulted, but coordination is not easy. It is also difficult to track actual spending from the central government to local institutions. And

private spending adds to the complexity of collecting accurate data on public spending.

The share of trained teachers in primary education measures the quality of the teaching staff. It does not take account of competencies acquired by teachers through their professional experience or self-instruction or of such factors as work experience, teaching methods and materials, or classroom conditions, which may affect the quality of teaching. Since the training teachers receive varies greatly (pre-service or in-service), care should be taken in making comparisons across countries.

The primary school pupil-teacher ratio reflects the average number of pupils per teacher. It differs from the average class size because of the different practices countries employ, such as part-time teachers, school shifts, and multigrade classes. The comparability of pupil-teacher ratios across countries is affected by the definition of teachers and by differences in class size by grade and in the number of hours taught, as well as the different practices mentioned above. Moreover, the underlying enrollment levels are subject to a variety of reporting errors (for further discussion of enrollment data, see About the data for table 2.12). While the pupil-teacher ratio is often used to compare the quality of schooling across countries, it is often weakly related to the value added of schooling systems.

In 1998 UNESCO introduced the new International Standard Classification of Education 1997 (ISCED 1997). Consistent historical time series with reclassification of the pre–ISCED 1997 series were produced for a selection of indicators in 2008. The full set of the historical series is forthcoming.

In 2006 the UNESCO Institute for Statistics also changed its convention for citing the reference year of education data and indicators to the calendar year in which the academic or financial year ends. Data that used to be listed for 2006, for example, are now listed for 2007. This change was implemented to present the most recent data available and to align the data reporting with that of other international organizations (in particular the Organisation for Economic Co-operation and Development and Eurostat).

Definitions

• Public expenditure per student is public current and capital spending on education divided by the number of students by level as a percentage of gross domestic product (GDP) per capita. • Public expenditure on education is current and capital public expenditure on education as a percentage of GDP and as a percentage of total government expenditure. • Trained teachers in primary education are the percentage of primary school teachers who have received the minimum organized teacher training (pre-service or in-service) required for teaching in their country. • Primary school pupil-teacher ratio is the number of pupils enrolled in primary school divided by the number of primary school teachers (regardless of their teaching assignment).

Data sources

Data on education inputs are from the UNESCO Institute for Statistics, which compiles international data on education in cooperation with national commissions and national statistical services.

Participation in education

About the data

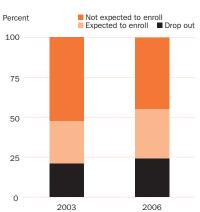

School enrollment data are reported to the United Nations Educational, Scientific, and Cultural Organization (UNESCO) Institute for Statistics by national education authorities and statistical offices. Enrollment ratios help monitor whether a country is on track to achieve the Millennium Development Goal of universal primary education by 2015, and whether an education system has the capacity to meet the needs of universal primary education, as indicated in part by gross enrollment ratios.

Enrollment ratios, while a useful measure of participation in education, have limitations. They are based on annual school surveys, which are typically conducted at the beginning of the school year and do not reflect actual attendance or dropout rates during the year. And school administrators may exaggerate enrollments, especially if there is a financial incentive to do so.

Also, the gross and net primary enrollment ratios have an inherent weakness: the length of primary education differs across countries, although the International Standard Classification of Education tries to minimize the difference. A shorter duration for primary education tends to increase the ratio; a longer one to decrease it (in part because more older children drop out).

Overage or underage enrollments are frequent, particularly when parents prefer children to start school

The situations of out of school children vary widely 2.12a

Some children who are out of school can be expected to enter school late, some have already had some contact with schooling but will drop out, and others will never enter school. For countries to reach the goal of education for all, policies that address all three situations will need to be implemented.

Source: UNESCO Institute for Statistics 2008b.

at other than the official age. Age at enrollment may be inaccurately estimated or misstated, especially in communities where registration of births is not strictly enforced.

Other problems of cross-country comparison stem from errors in school-age population estimates. Agesex structures drawn from censuses or vital registrations, the primary data sources on school-age population, commonly underenumerate (especially young children) to circumvent laws or regulations. Errors are also introduced when parents round children's ages. While census data are often adjusted for age bias, adjustments are rarely made for inadequate vital registration systems. Compounding these problems, pre- and postcensus estimates of school-age children are model interpolations or projections that may miss important demographic events (see discussion of demographic data in About the data for table 2.1).

Gross enrollment ratios indicate the capacity of each level of the education system, but a high ratio may reflect a substantial number of overage children enrolled in each grade because of repetition rather than a successful education system. The net enrollment ratio excludes overage and underage students to capture more accurately the system's coverage and internal efficiency but does not account for children who fall outside the official school age because of late or early entry rather than grade repetition. Differences between gross and net enrollment ratios show the incidence of overage and underage enrollments.

Adjusted net primary enrollment (called total net primary enrollment in the 2008 edition), recently added as a Millennium Development Goal indicator, captures primary-school-age children who have progressed to secondary education, which the traditional net enrollment ratio excludes.

Data on children out of school (primary-school-age children not enrolled in school—dropouts, children never enrolled, and children of primary age enrolled in preprimary education) are compiled from administrative data. Large numbers of children out of school create pressure to enroll children and provide classrooms, teachers, and educational materials, a task made difficult in many countries by limited education budgets. However, getting children into school is a high priority for countries and crucial for achieving the Millennium Development Goal of universal primary education.

In 2006 the UNESCO Institute for Statistics changed its convention for citing the reference year. For more information, see *About the data* for table 2.11.

Definitions

· Gross enrollment ratio is the ratio of total enrollment, regardless of age, to the population of the age group that officially corresponds to the level of education shown. • Preprimary education refers to the initial stage of organized instruction, designed primarily to introduce very young children to a school-type environment. • Primary education provides children with basic reading, writing, and mathematics skills along with an elementary understanding of such subjects as history, geography, natural science, social science, art, and music. • Secondary education completes the provision of basic education that began at the primary level and aims at laying the foundations for lifelong learning and human development by offering more subject- or skill-oriented instruction using more specialized teachers. • Tertiary education refers to a wide range of post-secondary education institutions, including technical and vocational education, colleges, and universities, whether or not leading to an advanced research qualification, that normally require as a minimum condition of admission the successful completion of education at the secondary level. • Net enrollment ratio is the ratio of total enrollment of children of official school age based on the International Standard Classification of Education 1997 to the population of the age group that officially corresponds to the level of education shown. • Adjusted net enrollment ratio, primary. is the ratio of total enrollment of children of official school age for primary education who are enrolled in primary or secondary education to the total primaryschool-age population. • Children out of school are the number of primary-school-age children not enrolled in primary or secondary school.

Data sources

Data on gross and net enrollment ratios and out of school children are from the UNESCO Institute for Statistics.

a. Provisional data. b. Less than 0.5. c. Data are for 2009. d. Data are for 2008.

About the data

The United Nations Educational, Scientific, and Cultural Organization (UNESCO) Institute for Statistics estimates indicators of students' progress through school. These indicators measure an education system's success in reaching all students, efficiently moving students from one grade to the next, and imparting a particular level of education.

The gross intake rate indicates the level of access to primary education and the education system's capacity to provide access to primary education. Low gross intake rates in grade 1 reflect the fact that many children do not enter primary school even though school attendance, at least through the primary level, is mandatory in all countries. Because the gross intake rate includes all new entrants regardless of age, it can exceed 100 percent in some situations, such as immediately after fees have been abolished or when the number of reenrolled children is large. The quality of data is reduced when new entrants and repeaters are not correctly distinguished in grade 1.

The cohort survival rate is the estimated proportion of an entering cohort of grade 1 students that eventually reaches grade 5 or the last grade of primary education. It measures an education system's holding power and internal efficiency. Rates approaching 100 percent indicate high retention and low dropout levels. Cohort survival rates are typically estimated from data on enrollment and repetition by grade for two consecutive years. This procedure, called the reconstructed cohort method, makes three simplifying assumptions: dropouts never return to school; promotion, repetition, and dropout rates remain constant over the period in which the cohort is enrolled in school; and the same rates apply to all pupils enrolled in a grade, regardless of whether they previously repeated a grade (Fredricksen 1993). Crosscountry comparisons should thus be made with caution, because other flows—caused by new entrants, reentrants, grade skipping, migration, or transfers during the school year—are not considered.

Data on repeaters are often used to indicate an education system's internal efficiency. Repeaters not only increase the cost of education for the family and the school system, but also use limited school resources. Country policies on repetition and promotion differ. In some cases the number of repeaters is controlled because of limited capacity. In other cases the number of repeaters is almost 0 because of automatic promotion—suggesting a system that is highly efficient but that may not be endowing students with enough cognitive skills. Care should be taken in interpreting this indicator.

The transition rate from primary to secondary school conveys the degree of access or transition between the two levels. As completing primary education is a prerequisite for participating in lower secondary school, growing numbers of primary completers will inevitably create pressure for more available places at the secondary level. A low transition rate can signal such problems as an inadequate examination and promotion system or insufficient secondary school capacity. The quality of data on the transition rate is affected when new entrants and repeaters are not correctly distinguished in the first grade of secondary school. Students who interrupt their studies after completing primary school could also affect data quality.

In 2006 the UNESCO Institute for Statistics changed its convention for citing the reference year. For more information, see About the data for table 2.11.

Definitions

- · Gross intake rate in grade 1 is the number of new entrants in the first grade of primary education regardless of age as a percentage of the population of the official primary school entrance age. • Cohort survival rate is the percentage of children enrolled in the first grade of primary school who eventually reach grade 5 or the last grade of primary education. The estimate is based on the reconstructed cohort method (see About the data). • Repeaters in primary school are the number of students enrolled in the same grade as in the previous year as a percentage of all students enrolled in primary school.
- · Transition to secondary school is the number of new entrants to the first grade of secondary school in a given year as a percentage of the number of students enrolled in the final grade of primary school in the previous year.

Data sources

Data on education efficiency are from the UNESCO Institute for Statistics.

Education completion and outcomes

About the data

Many governments publish statistics that indicate how their education systems are working and developing-statistics on enrollment and such efficiency indicators as repetition rates, pupil-teacher ratios, and cohort progression. The World Bank and the United Nations Educational, Scientific, and Cultural Organization (UNESCO) Institute for Statistics jointly developed the primary completion rate indicator. Increasingly used as a core indicator of an education system's performance, it reflects an education system's coverage and the educational attainment of students. The indicator is a key measure of education outcome at the primary level and of progress toward the Millennium Development Goals and the Education for All initiative. However, because curricula and standards for school completion vary across countries, a high primary completion rate does not necessarily mean high levels of student learning.

The primary completion rate reflects the primary cycle as defined by the International Standard Classification of Education, ranging from three or four years of primary education (in a very small number of countries) to five or six years (in most countries) and seven (in a small number of countries).

The table shows the proxy primary completion rate, calculated by subtracting the number of repeaters in the last grade of primary school from the total number of students in that grade and dividing by the total number of children of official graduation age. Data limitations preclude adjusting for students who drop out during the final year of primary school. Thus proxy rates should be taken as an upper estimate of the actual primary completion rate.

There are many reasons why the primary completion rate can exceed 100 percent. The numerator may include late entrants and overage children who have repeated one or more grades of primary school as well as children who entered school early, while the denominator is the number of children of official completing age. Other data limitations contribute to completion rates exceeding 100 percent, such as the use of population estimates of varying reliability, the conduct of school and population surveys at different times of year, and other discrepancies in the numbers used in the calculation.

Basic student outcomes include achievements in reading and mathematics judged against established standards. In many countries national assessments are enabling the ministry of education to monitor progress in these outcomes. Internationally comparable assessments are not yet available, except for a few, mostly industrialized, countries. The UNESCO

Institute for Statistics has established literacy as an outcome indicator based on an internationally agreed definition.

The literacy rate is the percentage of people who can, with understanding, both read and write a short, simple statement about their everyday life. In practice, literacy is difficult to measure. To estimate literacy using such a definition requires census or survey measurements under controlled conditions. Many countries estimate the number of literate people from self-reported data. Some use educational attainment data as a proxy but apply different lengths of school attendance or levels of completion. Because definitions and methodologies of data collection differ across countries, data should be used cautiously.

The reported literacy data are compiled by the UNESCO Institute for Statistics based on national censuses and household surveys during 1985–2007. For countries that have not reported national estimates, the UNESCO Institute for Statistics derived the modeled estimates. For detailed information on sources, definitions, and methodology, consult the original source.

Literacy statistics for most countries cover the population ages 15 and older, but some include younger ages or are confined to age ranges that tend to inflate literacy rates. The literacy data in the narrower age range of 15–24 better captures the ability of participants in the formal education system and reflects recent progress in education. The youth literacy rate reported in the table measures the accumulated outcomes of primary education over the previous 10 years or so by indicating the proportion of people who have passed through the primary education system and acquired basic literacy and numeracy skills.

Definitions

• Primary completion rate is the percentage of students completing the last year of primary school. It is calculated by taking the total number of students in the last grade of primary school, minus the number of repeaters in that grade, divided by the total number of children of official completing age. • Youth literacy rate is the percentage of people ages 15–24 that can, with understanding, both read and write a short, simple statement about their everyday life. • Adult literacy rate is the literacy rate among people ages

Data sources

Data on primary completion rates and literacy rates are from the UNESCO Institute for Statistics.

Education gaps by income and gender

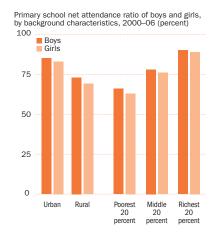

About the data

The data in the table describe basic information on school participation and educational attainment by individuals in different socioeconomic groups within countries. The data are from Demographic and Health Surveys conducted by Macro International with the support of the U.S. Agency for International Development, Multiple Indicator Cluster Surveys conducted by the United Nations Children's Fund (UNICEF), and Living Standards Measurement Studies conducted by the World Bank's Development Economics Research Group. These large-scale household sample surveys, conducted periodically in developing countries, collect information on a large number of health, nutrition, and population measures as well as on respondents' social, demographic, and economic characteristics using a standard set of questionnaires. The data presented here draw on responses to individual and household questionnaires.

Typically, the surveys collect basic information on educational attainment and enrollment levels from every household member ages 5 or 6 and older as part of household socioeconomic characteristics. The surveys are not intended for the collection of detailed education data; thus the education section of the surveys is not as detailed as the Demographic and Health Surveys health section and the data obtained from them do not replace other data on education flows. Still, the education data provide micro-level information on education that cannot be obtained from administrative data, such as information on children not attending school.

Gender disparities in net primary school attendance are largest in poor and rural households

2.15a

Source: UNICEF 2007.

Socioeconomic status as displayed in the table is based on a household's assets, including ownership of consumer items, features of the household's dwelling, and other characteristics related to wealth. Each household asset on which information was collected was assigned a weight generated through principal-component analysis, which is used to create break-points defining wealth quintiles, expressed as quintiles of individuals in the population.

The selection of the asset index for defining socioeconomic status was based on pragmatic rather than conceptual considerations: Demographic and Health Surveys do not collect income or consumption data but do have detailed information on households' ownership of consumer goods and access to a variety of goods and services. Like income or consumption, the asset index defines disparities primarily in economic terms. It therefore excludes other possibilities of disparities among groups, such as those based on gender, education, ethnic background, or other facets of social exclusion. To that extent the index provides only a partial view of the multidimensional concepts of poverty, inequality, and inequity.

Creating one index that includes all asset indicators limits the types of analysis that can be performed. In particular, the use of a unified index does not permit a disaggregated analysis to examine which asset indicators have a more or less important association with education status. In addition, some asset indicators may reflect household wealth better in some countries than in others-or reflect different degrees of wealth in different countries. Taking such information into account and creating countryspecific asset indexes with country-specific choices of asset indicators might produce a more effective and accurate index for each country. The asset index used in the table does not have this flexibility.

The analysis was carried out for about 80 countries. The table shows the most recent estimates for the poorest and richest quintiles and by gender only; the full set of estimates for all other subgroups, including by urban and rural location and for other years, is available in the country reports (see Data sources). The data in the table differ from data for similar indicators in preceding tables either because the indicator refers to a period a few years preceding the survey date or because the indicator definition or methodology is different. Findings should be used with caution because of measurement error inherent in the use of survey data.

Definitions

- . Survey year is the year in which the underlying data were collected. • Gross intake rate in grade 1 is the number of students in the first grade of primary education regardless of age as a percentage of the population of the official primary school entrance age. These data may differ from those in table 2.13.
- · Gross primary participation rate is the ratio of total students attending primary school regardless of age to the population of the age group that officially corresponds to primary education. • Average years of schooling are the years of formal schooling received, on average, by youths and adults ages 15-19. • Primary completion rate is the number of students in the last year of primary school minus the number of repeaters in that grade, divided by the number of students of official graduation age. These data differ from those in table 2.14 because the definition and methodology are different. • Children out of school are the percentage of children of official primary school age who are not attending primary or secondary education. Children of official primary school age who are attending preprimary education are considered out of school. These data differ from those in table 2.12 because the definition and methodology are different.

Data sources

Data on education gaps by income and gender are from an analysis by the World Bank's Human Development Network Education Group of Demographic and Health Surveys conducted by Macro International, Multiple Indicator Cluster Surveys conducted by UNICEF, and Living Standards Measurement Studies conducted by the World Bank's Development Economics Research Group and the World Bank, Country reports are available at www. worldbank.org/education/edstats/.

a. Data are for the most recent year available. b. Data are for 2009. c. Derived from incomplete data. d. Less than 0.05. e. Excludes northern Iraq. f. Includes contributions from the United Nations Relief and Works Agency for Palestine Refugees. g. Excludes Transnistria. h. Excludes Metohija.

Health systems—the combined arrangements of institutions and actions whose primary purpose is to promote, restore, or maintain health (World Health Organization, World Health Report 2000)—are increasingly being recognized as key to combating disease and improving the health status of populations. The World Bank's (2007a) Healthy Development: Strategy for Health, Nutrition, and Population Results emphasizes the need to strengthen health systems, which are weak in many countries, in order to increase the effectiveness of programs aimed at reducing specific diseases and further reduce morbidity and mortality (World Bank 2007a). To evaluate health systems, the World Health Organization (WHO) has recommended that key components—such as financing, service delivery, workforce, governance, and information—be monitored using several key indicators (WHO 2008b). The data in the table are a subset of the first four indicators. Monitoring health systems allows the effectiveness, efficiency, and equity of different health system models to be compared. Health system data also help identify weaknesses and strengths and areas that need investment, such as additional health facilities, better health information systems, or better trained human resources.

Health expenditure data are broken down into public and private expenditures, with private expenditure further broken down into out-of-pocket expenditure (direct payments by households to providers), which make up the largest proportion of private expenditures. In general, low-income economies have a higher share of private health expenditure than do middle- and high-income countries. High out-of-pocket expenditures may discourage people from accessing preventive or curative care and can impoverish households that cannot afford needed care. Health financing data are collected through national health accounts, which systematically, comprehensively, and consistently monitoring health system resource flows. To establish a national health account, countries must define the boundaries of the health system and classify health expenditure information along several dimensions, including sources of financing, providers of health services, functional use of health expenditures, and beneficiaries of expenditures. The accounting system can then provide an accurate picture of resource envelopes and financial flows and allow analysis of the equity and efficiency of financing to inform policy.

Many low-income countries use Demographic and Health Surveys or Multiple Indicator Cluster Surveys

funded by donors to obtain health system data. Data on health worker (physicians, nurses, and midwives) density shows the availability of medical personnel. The WHO estimates that at least 2.5 physicians, nurses, and midwives per 1,000 people are needed to provide adequate coverage with primary care interventions associated with achieving the Millennium Development Goals (WHO, World Health Report 2006). The WHO compiles data from household and labor force surveys, censuses, and administrative records. Data comparability is limited by differences in definitions and training of medical personnel varies. In addition, human resources tend to be concentrated in urban areas, so that average densities do not provide a full picture of health personnel available to the entire population.

Availability and use of health services, shown by hospital beds per 1,000 people and outpatient visits per capita, reflect both demand- and supply-side factors. In the absence of a consistent definition these are crude indicators of the extent of physical, financial, and other barriers to health care.

Definitions

- . Total health expenditure is the sum of public and private health expenditure. It covers the provision of health services (preventive and curative), family planning and nutrition activities, and emergency aid for health but excludes provision of water and sanitation. • Public health expenditure is recurrent and capital spending from central and local governments, external borrowing and grants (including donations from international agencies and nongovernmental organizations), and social (or compulsory) health insurance funds. • Out-of-pocket health expenditure, part of private health expenditure, is direct household outlays, including gratuities and in-kind payments, for health practitioners and pharmaceutical suppliers, therapeutic appliances, and other goods and services whose primary intent is to restore or enhance health. • Health expenditure per capita is total health expenditure divided by population in U.S. dollars and in international dollars converted using 2005 purchasing power parity (PPP) rates. • Physicians include generalist and specialist medical practitioners.. Nurses and midwives include professional nurses and midwives, auxiliary nurses and midwives, enrolled nurses and midwives, and other
- Physicians include generalist and specialist medical practitioners.
 Nurses and midwives include professional nurses and midwives, auxiliary nurses and midwives, enrolled nurses and midwives, and other personnel, such as dental nurses and primary care nurses.
 Hospital beds are inpatient beds for both acute and chronic care available in public, private, general, and specialized hospitals and rehabilitation centers.
 Outpatient visits per capita are the number of visits to health care facilities per capita, including repeat visits.

Data sources

Data on health expenditures are from the WHO's National Health Account database (www.who.int/nha/en), supplemented by country data. Data on physicians, nurses and midwives, hospital beds, and outpatient visits are from the WHO, Organisation for Economic Co-operation and Development, and TransMONEE, supplemented by country data.

a. Data are for the most recent year available.

According to the World Health Organization (WHO), health information systems are crucial for monitoring and evaluating health systems, which are increasingly recognized as important for combating disease and improving health status. Health information systems underpin decisionmaking through four data functions: generation, compilation, analysis and synthesis, and communication and use. The health information system collects data from the health sector and other relevant sectors; analyzes the data and ensures their overall quality, relevance, and timeliness; and converts data into information for healthrelated decisionmaking (WHO 2008b).

Numerous indicators have been proposed to assess a country's health information system. They can be grouped into two broad types: indicators related to data generation using core sources and methods (health surveys, civil registration, censuses, facility reporting, health system resource tracking) and indicators related to capacity for data synthesis, analysis, and validation. Indicators related to data generation reflect a country's capacity to collect relevant data at suitable intervals using the most appropriate data sources. Benchmarks include periodicity, timeliness, contents, and availability. Indicators related to capacity for synthesis, analysis, and validation measure the dimensions of the institutional frameworks needed to ensure data quality, including independence, transparency, and access. Benchmarks include the availability of independent coordination mechanisms and micro- and meta-data (WHO 2008a).

The indicators in the table are all related to data generation, including the years the last national health account, last health survey, and latest population census were completed. Frequency of data collection, a benchmark of data generation, is shown as the number of years for which a national health account was completed between 1995 and 2008. National health account data may be collected using different approaches such as Organisation for Economic Co-operation and Development (OECD) System of Health Accounts, WHO National Health Account producers guide approach, local national health accounting methods, or Pan American Health Organization/WHO satellite health accounts approach.

Indicators related to data generation include completeness of birth registration, infant death reporting, and total death reporting.

Definitions

available using the national health account approach. • Number of national health accounts completed is the number of national health accounts completed between 1995 and 2008. • Year of last health survey is the latest year the national survey that collects health information was conducted. • Year of last census is the latest year a census was conducted in the last 10 years. • Completeness of birth registration is the percentage of children under age 5 whose births were registered at the time of the survey. The numerator of completeness of birth registration includes children whose birth certificate was seen by the interviewer or whose mother or caretaker says the birth has been registered. • Completeness of infant death reporting is the number of infant deaths reported by national statistical authorities to the United Nations

Statistics Division's Demographic Yearbook divided

by the number of infant deaths estimated by the United Nations Population Division. • Complete-

ness of total death reporting is the number of total

deaths reported by national statistical authorities to

the United Nations Statistics Division's Demographic

Yearbook divided by the number of total deaths esti-

mated by the United Nations Population Division.

• Year last national health account completed is the

latest year for which the health expenditure data are

Data on year last national health account completed and number of national health accounts. completed were compiled by staff in the World Bank's Health, Nutrition, and Population Unit using data on the health expenditures reported by the WHO and OECD and consultation with colleagues from countries and other international organizations. Data on year of last health survey are from Macro International and the United Nations Children's Fund (UNICEF). Data on year of last census are from United Nations Statistics Division's 2010 World Population and Housing Census Program (http://unstats.un.org/unsd/demographic/ sources/census/2010_PHC/default.htm). Data on completeness of birth registration are compiled by UNICEF in State of the World's Children 2010 based mostly on household surveys and ministry of health data. Data used to calculate completeness of infant death reporting and total death reporting are from the United Nations Statistics Division's Population and Vital Statistics Report and the United Nations Population Division's World Population Prospects: The 2008 Revision.

a. For malaria prevention only. b. Refers to children who were immunized before age 12 months or in some cases at any time before the survey (12–23 months). c. Data are for the most recent year available. d. Data are for 2009. e. Includes Kosovo.

People's health is influenced by the environment in which they live. Lack of clean water and basic sanitation is the main reason diseases transmitted by feces are so common in developing countries. Access to drinking water from an improved source and access to improved sanitation do not ensure safety or adequacy, as these characteristics are not tested at the time of the surveys. But improved drinking water technologies and improved sanitation facilities are more likely than those characterized as unimproved to provide safe drinking water and to prevent contact with human excreta. The data are derived by the Joint Monitoring Programme (JMP) of the World Health Organization (WHO) and United Nations Children's Fund (UNICEF) based on national censuses and nationally representative household surveys. The coverage rates for water and sanitation are based on information from service users on the facilities their households actually use rather than on information from service providers, which may include nonfunctioning systems. While the estimates are based on use, the JMP reports use as access, because access is the term used in the Millennium Development Goal target for drinking water and sanitation.

Governments in developing countries usually finance immunization against measles and diphtheria, pertussis (whooping cough), and tetanus (DTP) as part of the basic public health package. In many developing countries lack of precise information on the size of the cohort of one-year-old children makes immunization coverage difficult to estimate from program statistics. The data shown here are based on an assessment of national immunization coverage rates by the WHO and UNICEF. The assessment considered both administrative data from service providers and household survey data on children's immunization histories. Based on the data available, consideration of potential biases, and contributions of local experts, the most likely true level of immunization coverage was determined for each year.

Acute respiratory infection continues to be a leading cause of death among young children, killing about 2 million children under age 5 in developing countries each year. Data are drawn mostly from household health surveys in which mothers report on number of episodes and treatment for acute respiratory infection.

Since 1990 diarrhea-related deaths among children have declined tremendously. Most diarrhea-related deaths are due to dehydration, and many of these deaths can be prevented with the use of oral

rehydration salts at home. However, recommendations for the use of oral rehydration therapy have changed over time based on scientific progress, so it is difficult to accurately compare use rates across countries. Until the current recommended method for home management of diarrhea is adopted and applied in all countries, the data should be used with caution. Also, the prevalence of diarrhea may vary by season. Since country surveys are administered at different times, data comparability is further affected.

Malaria is endemic to the poorest countries in the world, mainly in tropical and subtropical regions of Africa, Asia, and the Americas. Insecticide-treated nets, properly used and maintained, are one of the most important malaria-preventive strategies to limit human-mosquito contact. Studies have emphasized that mortality rates could be reduced by about 25–30 percent if every child under age 5 in malariarisk areas such as Africa slept under a treated net every night.

Prompt and effective treatment of malaria is a critical element of malaria control. It is vital that sufferers, especially children under age 5, start treatment within 24 hours of the onset of symptoms, to prevent progression—often rapid—to severe malaria and death.

Data on the success rate of tuberculosis treatment are provided for countries that have submitted data to the WHO. The treatment success rate for tuberculosis provides a useful indicator of the quality of health services. A low rate suggests that infectious patients may not be receiving adequate treatment. An important complement to the tuberculosis treatment success rate is the case detection rate, which indicates whether there is adequate coverage by the recommended case detection and treatment strategy.

Previous editions included the tuberculosis detection rates by DOTS, the internationally recommended strategy for tuberculosis control. This year's edition shows the tuberculosis detection rate for all detection methods, so data on the case detection rate cannot be compared with data in previous editions.

For indicators that are from household surveys, the year in the table refers to the survey year. For more information, consult the original sources.

Definitions

· Access to an improved water source refers to people with access to at least 20 liters of water a person a day from an improved source, such as piped water into a dwelling, public tap, tubewell, protected dug well, and rainwater collection, within 1 kilometer of the dwelling. • Access to improved sanitation facilities refers to people with at least adequate access to excreta disposal facilities that can effectively prevent human, animal, and insect contact with excreta. Improved facilities range from protected pit latrines to flush toilets. • Child immunization rate refers to children ages 12-23 months who, before 12 months or at any time before the survey, had received one dose of measles vaccine and three doses of diphtheria, pertussis (whooping cough), and tetanus (DTP3) vaccine. • Children with acute respiratory infection (ARI) taken to health provider are children under age 5 with ARI in the two weeks before the survey who were taken to an appropriate health provider. • Children with diarrhea who received oral rehydration and continuous feeding are children under age 5 with diarrhea in the two weeks before the survey who received either oral rehydration therapy or increased fluids, with continuous feeding. • Children sleeping under treated nets are children under age 5 who slept under an insecticide-treated net to prevent malaria the night before the survey. • Children with fever receiving antimalarial drugs are children under age 5 who were ill with fever in the two weeks before the survey and received any appropriate (locally defined) antimalarial drugs. • Tuberculosis treatment success rate is new registered infectious tuberculosis cases that were cured or that completed a full course of treatment as a percentage of smear-positive cases registered for treatment outcome evaluation. • Tuberculosis case detection rate is newly identified tuberculosis cases (including relapses) as a percentage of estimated incident cases (case detection, all forms).

Data sources

Data on access to water and sanitation are from the WHO and UNICEF's *Progress on Drinking Water and Sanitation* (2008). Data on immunization are from WHO and UNICEF estimates (www.who.int/immunization_monitoring). Data on children with ARI, with diarrhea, sleeping under treated nets, and receiving antimalarial drugs are from UNICEF's *State of the World's Children* 2009, Childinfo, and Demographic and Health Surveys by Macro International. Data on tuberculosis are from the WHO's *Global Tuberculosis Control: A Short Update to the* 2009 Report.

a. Data are for most recent year available. b. Includes Taiwan, China. c. Data are for 2009. d. Includes Montenegro.

Reproductive health is a state of physical and mental well-being in relation to the reproductive system and its functions and processes. Means of achieving reproductive health include education and services during pregnancy and childbirth, safe and effective contraception, and prevention and treatment of sexually transmitted diseases. Complications of pregnancy and childbirth are the leading cause of death and disability among women of reproductive age in developing countries.

Total and adolescent fertility rates are based on data on registered live births from vital registration systems or, in the absence of such systems, from censuses or sample surveys. The estimated rates are generally considered reliable measures of fertility in the recent past. Where no empirical information on age-specific fertility rates is available, a model is used to estimate the share of births to adolescents. For countries without vital registration systems fertility rates are generally based on extrapolations from trends observed in censuses or surveys from earlier

Unwanted fertility—actual fertility minus desired fertility—can been avoided when couples use effective contraception. One approach to measuring unwanted fertility is to calculate what the total fertility rate would be if all unwanted births were avoided—the wanted fertility rate. It is calculated in the same manner as the total fertility rate (from a household survey), but unwanted births are excluded from the numerator. Unwanted births are defined as those that exceed the number considered ideal by the same respondent in the survey.

More couples in developing countries want to limit or postpone childbearing but are not using effective contraception. These couples have an unmet need for contraception. Common reasons are lack of knowledge about contraceptive methods and concerns about possible side effects. This indicator excludes women not exposed to the risk of unintended pregnancy because of menopause, infertility, or postpartum anovulation.

Contraceptive prevalence reflects all methods—ineffective traditional methods as well as highly effective modern methods. Contraceptive prevalence rates are obtained mainly from household surveys, including Demographic and Health Surveys, Multiple Indicator Cluster Surveys, and contraceptive prevalence surveys (see *Primary data documentation* for the most recent survey year). Unmarried women are often excluded from such surveys, which may bias the estimates

Good prenatal and postnatal care improve maternal health and reduce maternal and infant mortality. But data may not reflect such improvements because health information systems are often weak, maternal deaths are underreported, and rates of maternal mortality are difficult to measure.

The share of births attended by skilled health staff is an indicator of a health system's ability to provide adequate care for pregnant women. Maternal mortality ratios are generally of unknown reliability, as are many other cause-specific mortality indicators. Household surveys such as Demographic and Health Surveys attempt to measure maternal mortality by asking respondents about survivorship of sisters. The main disadvantage of this method is that the estimates of maternal mortality that it produces pertain to 12 years or so before the survey, making them unsuitable for monitoring recent changes or observing the impact of interventions. In addition, measurement of maternal mortality is subject to many types of errors. Even in high-income countries with vital registration systems, misclassification of maternal deaths has been found to lead to serious

The national estimates of maternal mortality ratios in the table are based on national surveys, vital registration records, and surveillance data or are derived from community and hospital records. The modeled estimates are based on an exercise by the World Health Organization (WHO), United Nations Children's Fund (UNICEF), United Nations Population Fund (UNFPA), and World Bank. For countries with complete vital registration systems with good attribution of cause of death, the data are used as reported. For countries with national data either from complete vital registration systems with uncertain or poor attribution of cause of death or from household surveys reported maternal mortality was adjusted, usually by a factor of underenumeration and misclassification. For countries with no empirical national data (about 35 percent of countries), maternal mortality was estimated with a regression model using socioeconomic information, including fertility, birth attendants, and GDP. Neither set of ratios can be assumed to provide an exact estimate of maternal mortality for any of the countries in the table.

For the indicators that are from household surveys, the year in the table refers to the survey year. For more information, consult the original sources.

Definitions

• Total fertility rate is the number of children that would be born to a woman if she were to live to the end of her childbearing years and bear children in accordance with current age-specific fertility rates. • Wanted fertility rate is the estimated total fertility rate if all unwanted births were avoided. • Adolescent fertility rate is the number of births per 1,000 women ages 15-19. • Unmet need for contraception is the percentage of fertile, married women of reproductive age who do not want to become pregnant and are not using contraception. • Contraceptive prevalence rate is the percentage of women married or in union ages 15–49 who are practicing, or whose sexual partners are practicing, any form of contraception. • Pregnant women receiving prenatal care are the percentage of women attended at least once during pregnancy by skilled health personnel for reasons related to pregnancy. • Births attended by skilled health staff are the percentage of deliveries attended by personnel trained to give the necessary care to women during pregnancy, labor, and postpartum; to conduct deliveries on their own; and to care for newborns. • Maternal mortality ratio is the number of women who die from pregnancy-related causes during pregnancy and childbirth per 100,000 live births.

Data sources

Data on total fertility are compiled from the United Nations Population Division's World Population Prospects: The 2008 Revision, census reports and other statistical publications from national statistical offices, household surveys conducted by national agencies, Macro International, and the U.S. Centers for Disease Control and Prevention. Eurostat's Demographic Statistics, and the U.S. Bureau of the Census International Data Base. Data on wanted fertility are from Demographic and Health Surveys by Macro International. Data on adolescent fertility are from World Population Prospects: The 2008 Revision, with annual data linearly interpolated by the Development Data Group. Data on women with unmet need for contraception and contraceptive prevalence are from household surveys, including Demographic and Health Surveys by Macro International and Multiple Indicator Cluster Surveys by UNICEF. Data on pregnant women receiving prenatal care, births attended by skilled health staff, and national estimates of maternal mortality ratios are from UNICEF's State of the World's Children 2010 and Childinfo and Demographic and Health Surveys by Macro International. Modeled estimates of maternal mortality ratios are from WHO, UNICEF, UNFPA and the World Bank's Maternal Mortality in 2005 (2007).

a. Data are for the most recent year available. b. Country's vitamin A supplementation programs do not target children all the way up to 59 months of age. c. Includes Hong Kong SAR, China; Macau SAR, China; and Taiwan, China. d. Includes Montenegro.

Data on undernourishment are from the Food and Agriculture Organization (FAO) of the United Nations and measure food deprivation based on average food available for human consumption per person, the level of inequality in access to food, and the minimum calories required for an average person.

From a policy and program standpoint, however, this measure has its limits. First, food insecurity exists even where food availability is not a problem because of inadequate access of poor households to food. Second, food insecurity is an individual or household phenomenon, and the average food available to each person, even corrected for possible effects of low income, is not a good predictor of food insecurity among the population. And third, nutrition security is determined not only by food security but also by the quality of care of mothers and children and the quality of the household's health environment (Smith and Haddad 2000).

Estimates of child malnutrition, based on weight for age (underweight) and height for age (stunting), are from national survey data. The proportion of underweight children is the most common malnutrition indicator. Being even mildly underweight increases the risk of death and inhibits cognitive development in children. And it perpetuates the problem across generations, as malnourished women are more likely to have low-birthweight babies. Height for age reflects linear growth achieved pre- and postnatally; a deficit indicates long-term, cumulative effects of inadequate health, diet, or care. Stunting is often used as a proxy for multifaceted deprivation and as an indicator of long-term changes in malnutrition.

Estimates of overweight children are also from national survey data. Overweight children have become a growing concern in developing countries. Research shows an association between childhood obesity and a high prevalence of diabetes, respiratory disease, high blood pressure, and psychosocial and orthopedic disorders (de Onis and Blössner 2000).

New international growth reference standards for infants and young children were released in 2006 by the World Health Organization (WHO) to monitor children's nutritional status. They are also key in monitoring health targets for the Millennium Development Goals. Differences in growth to age 5 are influenced more by nutrition, feeding practices, environment, and healthcare than by genetics or ethnicity. The previously reported data were based on the U.S. National Center for Health Statistics—WHO growth reference. Because of the change in standards, the data in this edition should not be compared with data in editions prior to 2008.

Low birthweight, which is associated with maternal malnutrition, raises the risk of infant mortality and stunts growth in infancy and childhood. There is also emerging evidence that low-birthweight babies are more prone to noncommunicable diseases such as diabetes and cardiovascular diseases. Estimates of low-birthweight infants are drawn mostly from hospital records and household surveys. Many births in developing countries take place at home and are seldom recorded. A hospital birth may indicate higher income and therefore better nutrition, or it could indicate a higher risk birth, possibly skewing the data on birthweights downward. The data should therefore be used with caution.

Improved breastfeeding can save an estimated 1.3 million children a year. Breast milk alone contains all the nutrients, antibodies, hormones, and antioxidants an infant needs to thrive. It protects babies from diarrhea and acute respiratory infections, stimulates their immune systems and response to vaccination, and may confer cognitive benefits. The data on breastfeeding are derived from national surveys.

lodine deficiency is the single most important cause of preventable mental retardation, and it contributes significantly to the risk of stillbirth and miscarriage. Widely used and inexpensive, iodized salt is the best source of iodine, and a global campaign to iodize edible salt is significantly reducing the risks (www.childinfo.org). The data on iodized salt are derived from household surveys.

Vitamin A is essential for immune system functioning. Vitamin A deficiency, a leading cause of blindness, also causes a 23 percent greater risk of dying from a range of childhood ailments such as measles, malaria, and diarrhea. Giving vitamin A to new breastfeeding mothers helps protect their children during the first months of life. Food fortification with vitamin A is being introduced in many developing countries.

Data on anemia are compiled by the WHO based mainly on nationally representative surveys between 1993 and 2005, which measured hemoglobin in the blood. WHO's hemoglobin thresholds were then used to determine anemia status based on age, sex, and physiological status. Children under age 5 and pregnant women have the highest risk for anemia. Data should be used with caution because surveys differ in quality, coverage, age group interviewed, and treatment of missing values across countries and over time.

For indicators from household surveys, the year in the table refers to the survey year. For more information, consult the original sources.

Definitions

· Prevalence of undernourishment is the percentage of the population whose dietary energy consumption is continuously below a minimum requirement for maintaining a healthy life and carrying out light physical activity with an acceptable minimum weight for height. • Prevalence of child malnutrition is the percentage of children under age 5 whose weight for age (underweight) or height for age (stunting) is more than two standard deviations below the median for the international reference population ages 0-59 months. Height is measured by recumbent length for children up to two years old and by stature while standing for older children. Data are for the WHO child growth standards released in 2006. • Prevalence of overweight children is the percentage of children under age 5 whose weight for height is more than two standard deviations above the median for the international reference population of the corresponding age as established by the WHO child growth standards released in 2006. • Low-birthweight babies are the percentage of newborns weighing less than 2.5 kilograms within the first hours of life, before significant postnatal weight loss has occurred. • Exclusive breastfeeding is the percentage of children less than six months old who were fed breast milk alone (no other liquids) in the past 24 hours. • Consumption of iodized salt is the percentage of households that use edible salt fortified with iodine. • Vitamin A supplementation is the percentage of children ages 6-59 months old who received at least one dose of vitamin A in the previous six months, as reported by mothers.

- **Prevalence of anemia, children under age 5,** is the percentage of children under age 5 whose hemoglobin level is less than 110 grams per liter at sea level.
- **Prevalence of anemia, pregnant women,** is the percentage of pregnant women whose hemoglobin level is less than 110 grams per liter at sea level.

Data sources

Data on undernourishment are from www.fao. org/faostat/foodsecurity/index_en.htm. Data on malnutrition and overweight children are from the WHO's Global Database on Child Growth and Malnutrition (www.who.int/nutgrowthdb). Data on low-birthweight babies, breastfeeding, iodized salt consumption, and vitamin A supplementation are from the United Nations Children's Fund's State of the World's Children 2010 and Childinfo. Data on anemia are from the WHO's Worldwide Prevalence of Anemia 1993–2005 (2008) and Integrated WHO Nutrition Global Databases.

Health risk factors and future challenges

About the data

The limited availability of data on health status is a major constraint in assessing the health situation in developing countries. Surveillance data are lacking for many major public health concerns. Estimates of prevalence and incidence are available for some diseases but are often unreliable and incomplete. National health authorities differ widely in capacity and willingness to collect or report information. To compensate for this and improve reliability and international comparability, the World Health Organization (WHO) prepares estimates in accordance with epidemiological models and statistical standards.

Smoking is the most common form of tobacco use and the prevalence of smoking is therefore a good measure of the tobacco epidemic (Corrao and others 2000). Tobacco use causes heart and other vascular diseases and cancers of the lung and other organs. Given the long delay between starting to smoke and the onset of disease, the health impact of smoking in developing countries will increase rapidly only in the next few decades. Because the data present a one-time estimate, with no information on intensity or duration of smoking, and because the definition of adult varies, the data should be used with caution.

Tuberculosis is one of the main causes of adult deaths from a single infectious agent in developing countries. In developed countries tuberculosis has reemerged largely as a result of cases among immigrants. Since tuberculosis incidence cannot be directly measured, estimates are obtained by eliciting expert opinion or are derived from measurements of prevalence or mortality. These estimates include uncertainty intervals, which are not shown in the table.

Diabetes, an important cause of ill health and a risk factor for other diseases in developed countries, is spreading rapidly in developing countries. Highest among the elderly, prevalence rates are rising among younger and productive populations in developing countries. Economic development has led to the spread of Western lifestyles and diet to developing countries, resulting in a substantial increase in diabetes. Without effective prevention and control programs, diabetes will likely continue to increase. Data are estimated based on sample surveys.

Adult HIV prevalence rates reflect the rate of HIV infection in each country's population. Low national prevalence rates can be misleading, however. They often disguise epidemics that are initially concentrated in certain localities or population groups and threaten to spill over into the wider population. In many developing countries most new infections occur in young adults, with young women especially vulnerable.

The Joint United Nations Programme on HIV/AIDS (UNAIDS) and the WHO estimate HIV prevalence from sentinel surveillance, population-based surveys, and special studies. Since the 2009 edition the estimates in the table have been more reliable than previous estimates because of expanded sentinel surveillance and improved data quality. Findings from population-based HIV surveys, which are geographically more representative than sentinel surveillance and include both men and women, influenced a downward adjustment to prevalence rates based on sentinel surveillance. And assumptions about the average time people living with HIV survive without antiretroviral treatment were improved in the most recent model. Thus, estimates in this edition should not be compared with estimates in previous editions.

Estimates from recent Demographic and Health Surveys that have collected data on HIV/AIDS differ somewhat from those of UNAIDS and the WHO. which are based on surveillance systems that focus on pregnant women who attend sentinel antenatal clinics. Caution should be used in comparing the two sets of estimates. Demographic and Health Surveys are household surveys that use a representative sample from the whole population, whereas surveillance data from antenatal clinics are limited to pregnant women. Household surveys also frequently provide better coverage of rural populations. However, respondents who refuse to participate or are absent from the household add considerable uncertainty to survey-based HIV estimates, because the possible association of absence or refusal with higher HIV prevalence is unknown. UNAIDS and the WHO estimate HIV prevalence for the adult population (ages 15-49) by assuming that prevalence among pregnant women is a good approximation of prevalence among men and women. However, this assumption might not apply to all countries or over time. Other potential biases are associated with the use of antenatal clinic data, such as differences among women who attend antenatal clinics and

Data on condom use are from household surveys and refer to condom use at last intercourse. However, condoms are not as effective at preventing the transmission of HIV unless used consistently. Some surveys have asked directly about consistent use, but the question is subject to recall and other biases. Caution should be used in interpreting the data.

For indicators from household surveys, the year in the table refers to the survey year. For more information, consult the original sources.

Definitions

- · Prevalence of smoking is the adjusted and agestandardized prevalence estimate of smoking among adults. The age range varies but in most countries is 18 and older or 15 and older. • Incidence of tuberculosis is the estimated number of new tuberculosis cases (pulmonary, smear positive, extrapulmonary).
- Prevalence of diabetes refers to the percentage of people ages 20-79 who have type 1 or type 2 diabetes. • Prevalence of HIV is the percentage of people who are infected with HIV. Total and youth rates are percentages of the relevant age group. Female rate is as a percentage of the total population with HIV.
- Condom use is the percentage of the population ages 15-24 who used a condom at last intercourse in the last 12 months.

Data sources

Data on smoking are from the WHO's Report on the Global Tobacco Epidemic 2009: Implementing Smoke-Free Environments. Data on tuberculosis are from the WHO's Global Tuberculosis Control Report 2009. Data on diabetes are from the International Diabetes Federation's Diabetes Atlas, 3rd edition. Data on prevalence of HIV are from UNAIDS and the WHO's 2008 Report on the Global AIDS Epidemic. Data on condom use are from Demographic and Health Surveys by Macro International.

a. Data are for the most recent year available. b. Refers to a survey year. Values were estimated directly from surveys and cover the 5 or 10 years preceding the survey. c. Includes Taiwan, China. d. Excludes the French overseas departments of French Guiana, Guadeloupe, Martinique, and Réunion. e. Includes Kosovo. f. These world aggregates for 2008 do not include data for many lower mortality countries because recent estimates are unavailable. The world aggregates for 2006 are 213 for men and 143 for women. g. Data are for 2006.

Mortality rates for different age groups (infants, children, and adults) and overall mortality indicators (life expectancy at birth or survival to a given age) are important indicators of health status in a country. Because data on the incidence and prevalence of diseases are frequently unavailable, mortality rates are often used to identify vulnerable populations. And they are among the indicators most frequently used to compare socioeconomic development across countries.

The main sources of mortality data are vital registration systems and direct or indirect estimates based on sample surveys or censuses. A "complete" vital registration system—covering at least 90 percent of vital events in the population—is the best source of age-specific mortality data. Where reliable age-specific mortality data are available, life expectancy at birth is directly estimated from the life table constructed from age-specific mortality data.

But complete vital registration systems are fairly uncommon in developing countries. Thus estimates must be obtained from sample surveys or derived by applying indirect estimation techniques to registration, census, or survey data (see table 2.17 and Primary data documentation). Survey data are subject to recall error, and surveys estimating infant deaths require large samples because households in which a birth has occurred during a given year cannot ordinarily be preselected for sampling. Indirect estimates rely on model life tables that may be inappropriate for the population concerned. Because life expectancy at birth is estimated using infant mortality data and model life tables for many developing countries, similar reliability issues arise for this indicator. Extrapolations based on outdated surveys may not be reliable for monitoring changes in health status or for comparative analytical work.

Estimates of infant and under-five mortality tend to vary by source and method for a given time and place. Years for available estimates also vary by country, making comparison across countries and over time difficult. To make infant and under-five mortality estimates comparable and to ensure consistency across estimates by different agencies, the United Nations Children's Fund (UNICEF) and the World Bank (now working together with the World Health Organization (WHO), the United Nations Population Division, and other universities and research institutes as the Inter-agency Group for Child Mortality Estimation) developed and adopted a statistical method that uses all available information to reconcile differences. The method uses the

weighted least squares method to fit a regression line to the relationship between mortality rates and their reference dates and then extrapolate the trend to the present. (For further discussion of childhood mortality estimates, see UNICEF, WHO, World Bank, and United Nations Population Division 2007; for a graphic presentation and detailed background data, see www.childmortality.org).

Infant and child mortality rates are higher for boys than for girls in countries in which parental gender preferences are insignificant. Child mortality captures the effect of gender discrimination better than infant mortality does, as malnutrition and medical interventions are more important in this age group. Where female child mortality is higher, as in some countries in South Asia, girls probably have unequal access to resources. Child mortality rates in the table are not compatible with infant mortality and under-five mortality rates because of differences in methodology and reference year. Child mortality data were estimated directly from surveys and cover the 10 years preceding the survey. In addition to estimates from Demographic Health Surveys, estimates derived from Multiple Indicator Cluster Surveys have been added to the table; they cover the 5 years preceding the survey.

Rates for adult mortality and survival to age 65 come from life tables. Adult mortality rates increased notably in a dozen countries in Sub-Saharan Africa between 1995–2000 and 2000–05 and in several countries in Europe and Central Asia during the first half of the 1990s. In Sub-Saharan Africa the increase stems from AIDS-related mortality and affects both sexes, though women are more affected. In Europe and Central Asia the causes are more diverse (high prevalence of smoking, high-fat diet, excessive alcohol use, stressful conditions related to the economic transition) and affect men more.

The percentage of a hypothetical cohort surviving to age 65 reflects both child and adult mortality rates. Like life expectancy, it is a synthetic measure based on current age-specific mortality rates. It shows that even in countries where mortality is high, a certain share of the current birth cohort will live well beyond the life expectancy at birth, while in low-mortality countries close to 90 percent will reach at least age 65.

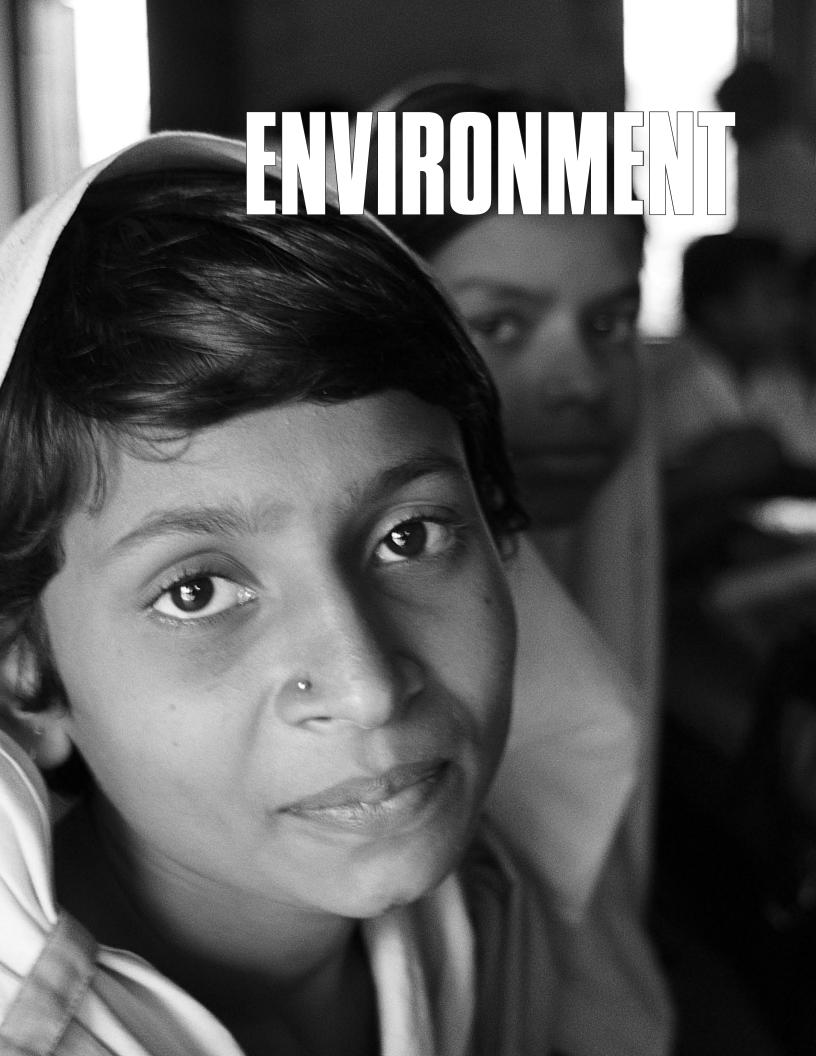

Annual data series from the United Nations are interpolated based on five-year estimates and thus may not reflect actual events.

Definitions

· Life expectancy at birth is the number of years a newborn infant would live if prevailing patterns of mortality at the time of its birth were to stay the same throughout its life. • Infant mortality rate is the number of infants dying before reaching one year of age, per 1,000 live births in a given year. • Underfive mortality rate is the probability per 1,000 that a newborn baby will die before reaching age 5, if subject to current age-specific mortality rates. • Child mortality rate is the probability per 1,000 of dying between ages 1 and 5—that is, the probability of a 1-year-old dying before reaching age 5—if subject to current age-specific mortality rates. • Adult mortality rate is the probability per 1,000 of dying between the ages of 15 and 60—that is, the probability of a 15-year-old dying before reaching age 60—if subject to current age-specific mortality rates between those ages. . Survival to age 65 refers to the percentage of a hypothetical cohort of newborn infants that would survive to age 65, if subject to current agespecific mortality rates.

Data sources

Data on infant and under-five mortality are estimates by the Inter-agency Group for Child Mortality Estimation based mainly on household surveys, censuses, and vital registration data, supplemented by the World Bank's Human Development Network estimates based on vital registration and sample registration data. Data on child mortality are from Demographic and Health Surveys by Macro International (Measure DHS) and World Bank calculations based on infant and under-five mortality from Multiple Indicator Cluster Surveys by UNICEF. Data on survival to age 65 and most data on adult mortality are linear interpolations of five-year data from World Population Prospects: The 2008 Revision. Remaining data on adult mortality are from the Human Mortality Database by the University of California, Berkeley, and the Max Planck Institute for Demographic Research (www. mortality.org). Data on life expectancy at birth are World Bank calculations based on male and female data from World Population Prospects: The 2008 Revision (for more than half of countries, most of them developing countries), census reports and other statistical publications from national statistical offices, Eurostat's Demographic Statistics, and the U.S. Bureau of the Census International Data Base.

lobal climate change presents a significant challenge to achieving the Millennium Development Goals (MDGs). The expected extreme changes in weather—such as shifts in the intensity and pattern of rainfall and variations in temperature—may lower agricultural productivity and damage infrastructure, leading to slower economic growth, threatening food security, and increasing poverty. Projected floods and droughts could cause many people to lose their livelihoods, be displaced, or migrate, while rising temperatures could increase the incidence of vector-borne diseases and lead to heat-related deaths and water scarcity.

The poorest countries and regions face the greatest danger. Africa—with the most rainfed agricultural land of any continent, half its population without access to improved water sources, and about 70 percent without access to improved sanitation facilities—is particularly vulnerable to climate change.

International action on greenhouse gas emissions and developing countries

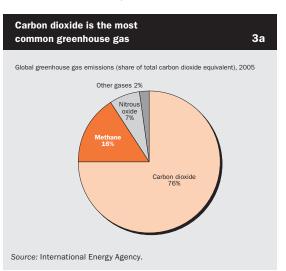

Economic growth—necessary for reducing poverty, improving people's lives, and achieving the MDGs—entails significant energy use. Generating this energy will affect greenhouse gas emissions. There is now consensus that greenhouse gas emissions need to peak by 2015 to curb emissions to about 50 percent of their 1990 levels by 2050, to keep global warming below 2°C, and to avoid more dangerous and catastrophic climate change (United Nations 2009b; World Bank 2009k). To meet this target and achieve the MDGs, sustainable energy systems need to be part of long-term economic planning for developed and developing countries.

The 2009 United Nations Climate Change Conference in Copenhagen did not reach a binding agreement on targets and timetables for reducing greenhouse gas emissions. The Copenhagen Accord recognized the critical importance of keeping global warming below 2°C and affirmed that the first priority of developing countries is to eradicate poverty and promote socioeconomic development—but that a low-emission development strategy is indispensable to sustainable development. On the principle of "differentiated responsibilities and respective capabilities," the accord urged developed countries to help developing countries in their mitigation efforts and their adaptation to the adverse effects of climate change (United Nations 2009c).

Greenhouse gas emissions have been rising at increasing rates

Carbon dioxide is the most common of the Kyoto Protocol greenhouse gases, which also include methane, nitrous oxide, and other artificial gases. It constitutes more than 75 percent of greenhouse gas emissions (figure 3a). About 80 percent of carbon dioxide is generated by the energy sector.

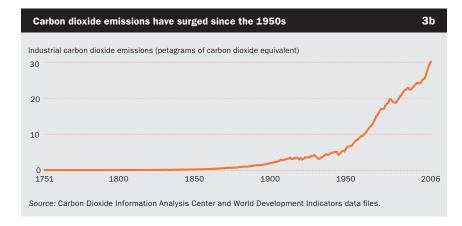

Carbon dioxide emissions, on the rise since the beginning of the industrial revolution 150 years ago, began to surge in the second half of the 20th century (figure 3b), reaching more than 30 petagrams (billion metric tons) a year in 2006 (see table 3.8).

High-income Organisation for Economic Co-operation and Development (OECD) countries, which have produced more than 55 percent of total cumulative emissions since the beginning of industrialization, stabilized their emissions growth at about 0.9 percent a year between 1990 and 2006.

Carbon dioxide emissions per capita from developing economies were less than a fourth those of developed economies in 2006, but their total emissions rate grew about twice as fast during 1990–2006 (table 3c). Over the same period carbon dioxide emissions grew 5.1 percent a year in China and 4.8 percent a year in India. China became the largest emitter of carbon dioxide in 2006 (see tables 3.8 and 3.9). During 1990–2006 developing economies' carbon energy intensity—the ratio of carbon dioxide emissions per unit of energy used—remained unchanged. But their carbon income intensity—the carbon dioxide emitted for each

	Carbon d	lioxide	(averag	intensity e annual wth)

unit of gross domestic product—decreased 2 percent a year, indicating greater economic productivity and energy efficiency.

The world's top five carbon dioxide emitters—China, the United States, the Russian Federation, India, and Japan (figure 3d)—all decreased their carbon income intensity in 1990–2006. Only China and India increased their carbon energy intensity, because of a higher share of fossil fuel in their energy consumption. Energy use has been increasing in China and India, both as a share of the global total and per capita. Among the five economies with the highest energy consumption, India uses fossil fuels the least—but its dependence on fossil fuels is growing the most, at about 1.3 percent annually during 1990–2007 (table 3e).

World energy consumption has increased about 2 percent a year since 1970 but decreased in 2009 because of the economic crisis. According to the International Energy Agency (IEA), energy demand could increase 40 percent by 2030 under business as usual conditions. Fossil fuels would remain the main energy source, accounting for 77 percent of increased demand during 2007-30 (IEA 2009). The IEA estimates that using fossil fuels at this rate will increase carbon dioxide emissions to about 40 petagrams a year by 2030, resulting in a long-term atmospheric concentration of 1,000 parts per million. This increase will be environmentally, socially, and economically unsustainable.

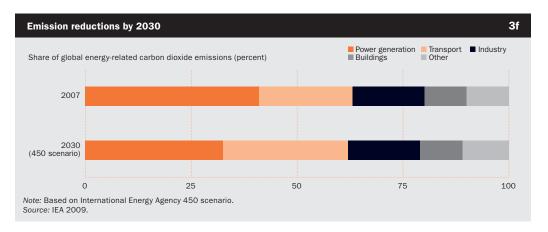

In Copenhagen the IEA proposed an emission reduction scenario to limit the concentration

of greenhouse gases in the atmosphere to 450 parts per million of carbon dioxide equivalent, which would reduce energy-related carbon dioxide emissions from 28.8 petagrams in 2007 to 26.4 petagrams in 2030. Under this scenario carbon dioxide emissions from the power sector are projected to be reduced the most (figure 3f). High-income OECD countries are projected

to reduce their power generation emissions from 484 grams of carbon dioxide per kilowatt hour of energy produced to 145, a 70 percent reduction. According to this scenario, high-income OECD economies should also reduce their carbon energy intensity by about 38 percent, and other economies by less than half that (table 3g).

Climate change will affect food and water security

During the last century rising atmospheric concentrations of carbon dioxide led to a 0.74°C increase in average global temperature. Even if greenhouse gas emissions stop growing, global warming is expected to continue because changes in temperature lag behind changes in concentrations, which lag behind changes in emissions (World Bank 2009k). According to the Intergovernmental Panel on Climate Change, during the coming decades global warming will cause droughts, floods, changes in rainfall patterns, severe freshwater shortages, and shifts in crop growing seasons—especially in developing countries (FAO 2008a). The agriculture and water sectors will be affected most by climate change, and adaptive measures are needed to mitigate expected adverse outcomes; otherwise, areas such as Southern Africa will suffer severe drops in agricultural yields by 2030 (World Bank 2009a) (table 3h). Developing countries already suffering from hunger and water supply problems, especially those in Southeast Asia and Sub-Saharan Africa, will be hardest hit without aid for adaptation.

Demand for water will increase, making better water management crucial

Properly using and managing water resources are important components of sustainable development—and essential for achieving the MDGs (World Bank and IMF 2008b; FAO 2010;

Bates and others 2008) (table 3i). Some 1 billion people lack access to safe water, and more than 2.5 billion need access to improved sanitation facilities. The world's population is growing by about 80 million people a year, demanding an additional 64 billion cubic meters of freshwater a year (UNESCO 2009). And about 90 percent of population growth by 2050 is projected to occur in developing countries, where many people still lack access to safe water and improved sanitation. By 2025, 1.8 billion people will be living in countries or regions with absolute water scarcity, and two-thirds of the world's population could be living under conditions of water stress (FAO 2007, 2010).

The effects of climate change on freshwater availability will depend on temperature increases, droughts, floods, regional variation in precipitation, and rising sea levels (UNESCO 2009; Bates and others 2008; Kundzewicz and Mata 2007; FAO 2008b). Precipitation is the most important source of freshwater; 80 percent of the world's cultivated land and about 60 percent of crops depend on rainwater (UNESCO 2009). Climate change models predict more precipitation in high latitudes and the tropics but less precipitation in subtropical regions such as the northern Sahara (UNESCO 2009; Kundzewicz and Mata 2007; IPCC 2007). In addition, non-climate-related water stressessuch as industrial water pollution, extensive irrigation, construction of dams, and draining of wetlands—have already raised concerns about future freshwater shortages (Bates and others 2008).

Go	al	Relation to water							
1	Eradicate extreme poverty and hunger	Water is a factor in many production activities (agriculture, animal husbandry, cottage industries).							
3	Promote gender equity and empower women	More gender-sensitive water management programs can reduce time wasted and health burdens through improved water service, leading to more time for income earning and more-balanced gender roles.							
4	Reduce child mortality	Improved access to more and better quality drinking water and improved sanitation can reduce the main factors contributing to illness and death among young children.							
6	Combat HIV/AIDS, malaria, and other diseases	Improved access to water and sanitation supports HIV/AIDS-affected households and may improve the impact of health care programs. Better water management reduces mosquito habitats and the risk of malaria transmission.							
7	Ensure environmental sustainability	Improved water management reduces water consumption and allows recycling of nutrients and organics. Action could ensure improved water supply and sanitation services for poor communities, and reduced wastewater discharge and improved environmental health in slum areas.							

In response to higher freshwater demand and geographic changes in water supply caused by climate change and other factors, countries must improve water storage, use water more efficiently, reuse freshwater (especially in agriculture), and use technology to anticipate regional, local, and seasonal variation in water availability and water use (UNESCO 2009; Bates and others 2008; Faurèsa, Hoogeveena, and Bruinsmab 2004; FAO 2009a).

Sustainable agriculture can help developing countries adapt to climate change

Sustainable agriculture is essential for development—and for achieving the MDG to eradicate poverty and hunger (World Bank and IFPRI 2006). Today's challenges for sustainable agricultural development are to respond to increasing demand for food, adjust to rapid climate changes caused by global warming, and reduce agricultural greenhouse gas emissions (FAO 2008a).

Adaptation strategies for agriculture will require balancing many environmental variables and socioeconomic factors—and their interactions. Countries may integrate climate change

adaptation and MDG efforts into their sustainable development policies. Research and development in sustainable agriculture could significantly affect agricultural resource conservation, promoting synergy among human needs.

The agriculture sector also causes greenhouse gas emissions—primarily nitrous oxide and methane. Climate change mitigation in agriculture will require more efficient use of fertilizer, soil conservation, and better production management. Inefficient use of fertilizers has undesirable environmental impacts, such as increased nitrogen loss into the atmosphere. Under current fertilization practices, crop plant uptake of nitrogen as a nutrient is about 50 percent, with losses and emissions to the atmosphere through runoff and leaching from soil erosion (Takle and Hofstrand 2008; FAO 2001). Use of fossil fuels in agricultural production causes 7 percent of agricultural emissions, primarily from combustion of gasoline and diesel fuel (Takle and Hofstrand 2008). Capturing and using methane from livestock production as an energy source can reduce emissions and improve profitability by reducing the need to buy fossil fuel energy (Takle and Hofstrand 2008).

a. Data are not available for all three years. b. Includes Luxembourg. c. Data are from national sources. d. Provisional estimate.

About the data

With more than 3 billion people, including 70 percent of the world's poor people, living in rural areas, adequate indicators to monitor progress in rural areas are essential. However, few indicators are disaggregated between rural and urban areas (for some that are, see tables 2.7, 3.5, and 3.11). The table shows indicators of rural population and land use. Rural population is approximated as the midyear nonurban population. While a practical means of identifying the rural population, it is not precise (see box 3.1a for further discussion).

The data in the table show that land use patterns are changing. They also indicate major differences in resource endowments and uses among countries. True comparability of the data is limited, however, by variations in definitions, statistical methods, and quality of data. Countries use different definitions of rural and urban population and land use. The Food and Agriculture Organization of the United Nations (FAO), the primary compiler of the data, occasionally adjusts its definitions of land use categories and revises earlier data. Because the data reflect changes in reporting procedures as well as actual changes in land use, apparent trends should be interpreted cautiously.

Satellite images show land use that differs from that of ground-based measures in area under cultivation and type of land use. Moreover, land use data in some countries (India is an example) are based on reporting systems designed for collecting tax revenue. With land taxes no longer a major source of government revenue, the quality and coverage of land use data have declined. Data on forest area may be particularly unreliable because of irregular surveys and differences in definitions (see About the data for table 3.4). FAO's Global Forest Resources Assessment 2005 is an important background document for the data. Conducted during 2003-05, it covers 229 countries and is the most comprehensive assessment of forests, forestry, and the benefits of forest resources in both scope and number of countries and people involved. It examines status and trends for about 40 variables on the extent, condition, uses, and values of forests and other wooded land.

What is rural? Urban? 3.1a

The rural population identified in table 3.1 is approximated as the difference between total population and urban population, calculated using the urban share reported by the United Nations Population Division. There is no universal standard for distinguishing rural from urban areas, and any urban-rural dichotomy is an oversimplification (see *About the data* for table 3.11). The two distinct images—isolated farm, thriving metropolis—represent poles on a continuum. Life changes along a variety of dimensions, moving from the most remote forest outpost through fields and pastures, past tiny hamlets, through small towns with weekly farm markets, into intensively cultivated areas near large towns and small cities, eventually reaching the center of a megacity. Along the way access to infrastructure, social services, and nonfarm employment increase, and with them population density and income. Because rurality has many dimensions, for policy purposes the rural-urban dichotomy presented in tables 3.1, 3.5, and 3.11 is inadequate.

A 2005 World Bank Policy Research Paper proposes an operational definition of rurality based on population density and distance to large cities (Chomitz, Buys, and Thomas 2005). The report argues that these criteria are important gradients along which economic behavior and appropriate development interventions vary substantially. Where population densities are low, markets of all kinds are thin, and the unit cost of delivering most social services and many types of infrastructure is high. Where large urban areas are distant, farm-gate or factory-gate prices of outputs will be low and input prices will be high, and it will be difficult to recruit skilled people to public service or private enterprises. Thus, low population density and remoteness together define a set of rural areas that face special development challenges.

Using these criteria and the Gridded Population of the World (CIESIN 2005), the authors' estimates of the rural population for Latin America and the Caribbean differ substantially from those in table 3.1. Their estimates range from 13 percent of the population, based on a population density of less than 20 people per square kilometer, to 64 percent, based on a population density of more than 500 people per square kilometer. Taking remoteness into account, the estimated rural population would be 13–52 percent. The estimate for Latin America and the Caribbean in table 3.1 is 21 percent.

Definitions

• Rural population is calculated as the difference between the total population and the urban population (see Definitions for tables 2.1 and 3.11). • Land area is a country's total area, excluding area under inland water bodies and national claims to the continental shelf and to exclusive economic zones. In most cases the definition of inland water bodies includes major rivers and lakes. (See table 1.1 for the total surface area of countries.) Variations from year to year may be due to updated or revised data rather than to change in area. • Land use can be broken into several categories, three of which are presented in the table (not shown are land used as permanent pasture and land under urban developments). • Forest area is land under natural or planted stands of trees of at least 5 meters in height in situ, whether productive or not, and excludes tree stands in agricultural production systems (for example, in fruit plantations and agroforestry systems) and trees in urban parks and gardens. • Permanent cropland is land cultivated with crops that occupy the land for long periods and need not be replanted after each harvest, such as cocoa, coffee, and rubber. Land under flowering shrubs, fruit trees, nut trees, and vines is included, but land under trees grown for wood or timber is not. • Arable land is land defined by the FAO as under temporary crops (double-cropped areas are counted once), temporary meadows for mowing or pasture, land under market or kitchen gardens, and land temporarily fallow. Land abandoned as a result of shifting cultivation is excluded.

Data sources

Data on urban population shares used to estimate rural population are from the United Nations Population Division's *World Urbanization Prospects: The 2007 Revision*, and data on total population are World Bank estimates. Data on land area and land use are from the FAO's electronic files. The FAO gathers these data from national agencies through annual questionnaires and by analyzing the results of national agricultural censuses.

a. Includes permanent pastures, arable land, and land under permanent crops. b. Data are not available for all three years. c. Includes Luxembourg.

About the data

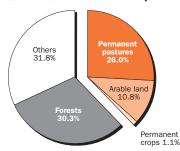

Agriculture is still a major sector in many economies, and agricultural activities provide developing countries with food and revenue. But agricultural activities also can degrade natural resources. Poor farming practices can cause soil erosion and loss of soil fertility. Efforts to increase productivity by using chemical fertilizers, pesticides, and intensive irrigation have environmental costs and health impacts. Excessive use of chemical fertilizers can alter the chemistry of soil. Pesticide poisoning is common in developing countries. And salinization of irrigated land diminishes soil fertility. Thus, inappropriate use of inputs for agricultural production has far-reaching effects.

The table provides indicators of major inputs to agricultural production: land, fertilizer, labor, and machinery. There is no single correct mix of inputs:

Nearly 40 percent of land globally is devoted to agriculture

3.2a

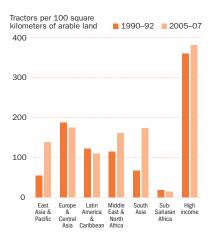

Note: Agricultural land includes permanent pastures, arable land, and land under permanent crops.

Source: Tables 3.1 and 3.2.

Developing regions lag in agricultural machinery, which reduces their agricultural productivity 3.2b

Source: Table 3.2.

appropriate levels and application rates vary by country and over time and depend on the type of crops, the climate and soils, and the production process used.

The agriculture sector is the most water-intensive sector, and water delivery in agriculture is increasingly important. The table shows irrigated agricultural land as share of total agricultural land area and data on average precipitation to illustrate how countries obtain water for agricultural use.

The data shown here and in table 3.3 are collected by the Food and Agriculture Organization of the United Nations (FAO) through annual questionnaires. The FAO tries to impose standard definitions and reporting methods, but complete consistency across countries and over time is not possible. Thus, data on agricultural land in different climates may not be comparable. For example, permanent pastures are quite different in nature and intensity in African countries and dry Middle Eastern countries. Data on agricultural employment, in particular, should be used with caution. In many countries much agricultural employment is informal and unrecorded, including substantial work performed by women and children. To address some of these concerns, this indicator is heavily footnoted in the database in sources, definition, and coverage.

Fertilizer consumption measures the quantity of plant nutrients. Consumption is calculated as production plus imports minus exports. Because some chemical compounds used for fertilizers have other industrial applications, the consumption data may overstate the quantity available for crops. Fertilizer consumption as a share of production shows the agriculture sector's vulnerability to import and energy price fluctuation. The FAO recently revised the time series for fertilizer consumption and irrigation for 2002 onward, but recent data are not available for all countries. FAO collects fertilizer statistics for production, imports, exports, and consumption through the new FAO fertilizer resources questionnaire. In the previous release, the data were based on total consumption of fertilizers, but the data in the recent release are based on the nutrients in fertilizers. Some countries compile fertilizer data on a calendar year basis, while others do so on a crop year basis (July-June). Previous editions of World Development Indicators reported data on a crop year basis, but this edition uses the calendar year, as adopted by the FAO. Caution should thus be used when comparing data over time.

To smooth annual fluctuations in agricultural activity, all the indicators in the table (except average annual precipitation) have been averaged over three years.

Definitions

· Agricultural land is the share of land area that is permanent pastures, arable, or under permanent crops. Permanent pasture is land used for five or more years for forage, including natural and cultivated crops. Arable land includes land defined by the FAO as land under temporary crops (double-cropped areas are counted once), temporary meadows for mowing or for pasture, land under market or kitchen gardens, and land temporarily fallow. Land abandoned as a result of shifting cultivation is excluded. Land under permanent crops is land cultivated with crops that occupy the land for long periods and need not be replanted after each harvest, such as cocoa, coffee, and rubber. Land under flowering shrubs, fruit trees, nut trees, and vines is included, but land under trees grown for wood or timber is not. • Irrigated land refers to areas purposely provided with water, including land irrigated by controlled flooding. . Average annual precipitation is the long-term average in depth (over space and time) of annual precipitation in the country. Precipitation is defined as any kind of water that falls from clouds as a liquid or a solid. • Land under cereal production refers to harvested areas, although some countries report only sown or cultivated area. • Fertilizer consumption is the quantity of plant nutrients used per unit of arable land. Fertilizer products cover nitrogen, potash, and phosphate fertilizers (including ground rock phosphate). Traditional nutrients—animal and plant manuresare not included. • Fertilizer production is fertilizer consumption, exports, and nonfertilizer use of fertilizer products minus fertilizer imports. • Agricultural employment is employment in agriculture, forestry, hunting, and fishing (see table 2.3). • Agricultural machinery refers to wheel and crawler tractors (excluding garden tractors) in use in agriculture at the end of the calendar year specified or during the first quarter of the following year.

Data sources

Data on agricultural inputs are from electronic files that the FAO makes available to the World Bank.

a. Data are not available for all three years. b. Includes Luxembourg. c. Includes Montenegro.

About the data

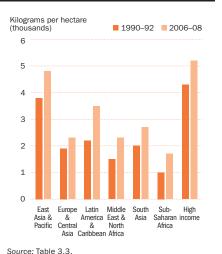

The agricultural production indexes in the table are prepared by the Food and Agriculture Organization of the United Nations (FAO). The FAO obtains data from official and semiofficial reports of crop yields, area under production, and livestock numbers. If data are unavailable, the FAO makes estimates. The indexes are calculated using the Laspeyres formula: production quantities of each commodity are weighted by average international commodity prices in the base period and summed for each year. Because the FAO's indexes are based on the concept of agriculture as a

Cereal vield in low-income economies is less than 40 percent of the yield in high-income countries 3.3a

Source: Table 3.3.

Sub-Saharan Africa has the lowest yield, while East Asia and Pacific is closing the gap with high-income economies 3.3b

single enterprise, estimates of the amounts retained for seed and feed are subtracted from the production data to avoid double counting. The resulting aggregate represents production available for any use except as seed and feed. The FAO's indexes may differ from those from other sources because of differences in coverage, weights, concepts, time periods, calculation methods, and use of interna-

To facilitate cross-country comparisons, the FAO uses international commodity prices to value production. These prices, expressed in international dollars (equivalent in purchasing power to the U.S. dollar), are derived using a Geary-Khamis formula applied to agricultural outputs (see United Nations System of National Accounts 1993, sections 16.93-96). This method assigns a single price to each commodity so that, for example, one metric ton of wheat has the same price regardless of where it was produced. The use of international prices eliminates fluctuations in the value of output due to transitory movements of nominal exchange rates unrelated to the purchasing power of the domestic currency.

Data on cereal yield may be affected by a variety of reporting and timing differences. Millet and sorghum, which are grown as feed for livestock and poultry in Europe and North America, are used as food in Africa, Asia, and countries of the former Soviet Union, So. some cereal crops are excluded from the data for some countries and included elsewhere, depending on their use. To smooth annual fluctuations in agricultural activity, the indicators in the table have been averaged over three years.

Definitions

• Crop production index is agricultural production for each period relative to the base period 1999-2001. It includes all crops except fodder crops. The regional and income group aggregates for the FAO's production indexes are calculated from the underlying values in international dollars, normalized to the base period 1999-2001. • Food production index covers food crops that are considered edible and that contain nutrients. Coffee and tea are excluded because, although edible, they have no nutritive value. • Livestock production index includes meat and milk from all sources, dairy products such as cheese, and eggs, honey, raw silk, wool, and hides and skins. • Cereal yield, measured in kilograms per hectare of harvested land, includes wheat, rice, maize, barley, oats, rye, millet, sorghum, buckwheat, and mixed grains. Production data on cereals refer to crops harvested for dry grain only. Cereal crops harvested for hay or harvested green for food, feed, or silage, and those used for grazing, are excluded. The FAO allocates production data to the calendar year in which the bulk of the harvest took place. But most of a crop harvested near the end of a year will be used in the following year. • Agricultural productivity is the ratio of agricultural value added, measured in 2000 U.S. dollars, to the number of workers in agriculture. Agricultural productivity is measured by value added per unit of input. (For further discussion of the calculation of value added in national accounts, see About the data for tables 4.1 and 4.2.) Agricultural value added includes that from forestry and fishing. Thus interpretations of land productivity should be made with caution.

Data sources

Data on agricultural production indexes, cereal yield, and agricultural employment are from electronic files that the FAO makes available to the World Bank. The files may contain more recent information than published versions. Data on agricultural value added are from the World Bank's national accounts files.

a. Negative values indicate an increase in forest area. b. Flowering plants only. c. Less than 0.5. d. Data are from national sources.

Deforestation and biodiversity

About the data

Biological diversity is defined in terms of variability in genes, species, and ecosystems. A 2008 comprehensive assessment of world species shows that at least 1,141 of 5,487 known mammals are threatened with extinction. As threats to biodiversity mount, the international community is increasingly focusing on conserving diversity. Deforestation is a major cause of loss of biodiversity, and habitat conservation is vital for stemming this loss. Conservation efforts have focused on protecting areas of high biodiversity.

The Food and Agriculture Organization of the United Nations (FAO) *Global Forest Resources Assessment 2005* provides detailed information on forest cover in 2005 and adjusted estimates of forest cover in 1990 and 2000. The current survey uses a uniform definition of forest. Because of space limitations, the table does not break down forest cover between natural forest and plantation, a breakdown the FAO provides for developing countries. Thus the deforestation data in the table may underestimate the rate at which natural forest is disappearing in some countries.

The number of threatened species is also an important measure of the immediate need for conservation in an area. Global analyses of the status of threatened species have been carried out for few groups of organisms. Only for mammals, birds, and amphibians has the status of virtually all known species been assessed. Threatened species are defined using the World Conservation Union's (IUCN) classification: endangered (in danger of extinction and unlikely to survive if causal factors continue operating) and vulnerable (likely to move into the endangered category in the near future if causal factors continue operating).

Unlike mammals, birds, and fish, it is difficult to accurately count plants. The number of plant species is highly debated. The 2008 IUCN Red List of Threatened Species, the result of more than 20 years' work by botanists worldwide, is the most comprehensive list of threatened species on a global scale. Only 5 percent of plant species have been evaluated, and 70 percent of these are threatened with extinction. Plant species data may not be comparable across countries because of differences in taxonomic concepts and coverage and so should be used with caution. However, the data identify countries that are major sources of global biodiversity and that show national commitments to habitat protection.

The Global Environment Facility's (GEF) benefits index for biodiversity is a comprehensive indicator of national biodiversity status and is used to guide its biodiversity priorities. The indicator incorporates

information on individual species range maps available from the IUCN for virtually all mammals (5,487), amphibians (5,915), and endangered birds (1,098); country data from the World Resources Institute for reptiles and vascular plants; country data from FishBase for 31.190 fish species; and the ecological characteristics of 867 world terrestrial ecoregions from WWF International. For each country the biodiversity indicator incorporates the best available and comparable information in four relevant dimensions: represented species, threatened species, represented ecoregions, and threatened ecoregions. To combine these dimensions into one measure, the indicator uses dimensional weights that reflect the consensus of conservation scientists at the GEF, IUCN, WWF International, and other nongovernmental organizations.

The World Conservation Monitoring Centre (WCMC) compiles data on protected areas, numbers of certain species, and numbers of those species under threat from various sources. Because of differences in definitions, reporting practices, and reporting periods, cross-country comparability is limited.

Nationally protected areas are defined using the six IUCN management categories for areas of at least 1,000 hectares: scientific reserves and strict nature reserves with limited public access; national parks of national or international significance and not materially affected by human activity; natural monuments and natural landscapes with unique aspects; managed nature reserves and wildlife sanctuaries; protected landscapes (which may include cultural landscapes); and areas managed mainly for the sustainable use of natural systems to ensure long-term protection and maintenance of biological diversity. The data in the table cover these six categories as well as terrestrial protected areas that are not assigned to a category by the IUCN. Designating an area as protected does not mean that protection is in force. And for small countries that have only protected areas smaller than 1,000 hectares, the size limit in the definition leads to an underestimate of protected areas.

Due to variations in consistency and methods of collection, data quality is highly variable across countries. Some countries update their information more frequently than others, some have more accurate data on extent of coverage, and many underreport the number or extent of protected areas.

Definitions

 Forest area is land under natural or planted stands of trees, whether productive or not. • Average annual deforestation is the permanent conversion of natural forest area to other uses, including agriculture, ranching, settlements, and infrastructure. It does not include areas logged but intended for regeneration or areas degraded by fuelwood gathering, acid precipitation, or forest fires. • Threatened species are species classified by the IUCN as endangered, vulnerable, rare, indeterminate, out of danger, or insufficiently known. Mammals exclude whales and porpoises. Birds are listed for the country where their breeding or wintering ranges are located. Fish are cold-blooded aquatic vertebrates of the superclass Pisces. Higher plants are native vascular plant species. • GEF benefits index for biodiversity is a composite index of relative biodiversity potential based on the species in each country and their threat status and diversity of habitat types. The index is normalized from 0 (no biodiversity potential) to 100 (maximum biodiversity potential). • Nationally protected areas are totally or partially protected areas of at least 1,000 hectares that are designated as scientific reserves with limited public access, national parks, natural monuments, nature reserves or wildlife sanctuaries, and protected landscapes. Terrestrial protected areas exclude marine areas, unclassified areas, littoral (intertidal) areas, and sites protected under local or provincial law. Marine protected areas are areas of intertidal or subtidal terrain-and overlying water and associated flora and fauna and historical and cultural features—that have been reserved to protect part of or the entire enclosed environment.

Data sources

Data on forest area are from the FAO's electronic files. The FAO gathers these data from national agencies through annual questionnaires and country official publications and websites and by analyzing national agricultural censuses. Data on species are from the electronic files of the United Nations Environment Programme (UNEP) and WCMC, the 2008 IUCN Red List of Threatened Species, and Froese and Pauly's (2008) FishBase database. The GEF benefits index for biodiversity is from Pandey and others' "Biodiversity Conservation Indicators: New Tools for Priority Setting at the Global Environment Facility" (2006a). Data on protected areas are from the UNEP and WCMC, as compiled by the World Resources Institute, based on data from national authorities and national legislation and international agreements.

a. Excludes river flows from other countries because of data unreliability. b. Food and Agriculture Organization estimates. c. Less than 0.5. d. Includes Montenegro. e. Includes Kosovo and Metohija.

About the data

The data on freshwater resources are based on estimates of runoff into rivers and recharge of groundwater. These estimates are based on different sources and refer to different years, so crosscountry comparisons should be made with caution. Because the data are collected intermittently, they may hide significant variations in total renewable water resources from year to year. The data also fail to distinguish between seasonal and geographic variations in water availability within countries. Data for small countries and countries in arid and semiarid zones are less reliable than those for larger countries and countries with greater rainfall.

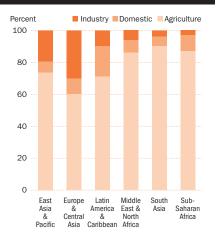

Caution should also be used in comparing data on annual freshwater withdrawals, which are subject

Agriculture is still the largest user of water, accounting for some 70 percent 3.5a of global withdrawals in 2007 . . .

Source: Table 3.5.

. . . and approaching 90 percent in some developing regions in 2007 3.5b

Source: Table 3.5.

to variations in collection and estimation methods. In addition, inflows and outflows are estimated at different times and at different levels of quality and precision, requiring caution in interpreting the data, particularly for water-short countries, notably in the Middle East and North Africa.

Water productivity is an indication only of the efficiency by which each country uses its water resources. Given the different economic structure of each country, these indicators should be used carefully, taking into account the countries' sectoral activities and natural resource endowments.

The data on access to an improved water source measure the percentage of the population with ready access to water for domestic purposes. The data are based on surveys and estimates provided by governments to the Joint Monitoring Programme of the World Health Organization (WHO) and the United Nations Children's Fund (UNICEF). The coverage rates are based on information from service users on actual household use rather than on information from service providers, which may include nonfunctioning systems. Access to drinking water from an improved source does not ensure that the water is safe or adequate, as these characteristics are not tested at the time of survey. While information on access to an improved water source is widely used, it is extremely subjective, and such terms as safe, improved, adequate, and reasonable may have different meaning in different countries despite official WHO definitions (see Definitions). Even in highincome countries treated water may not always be safe to drink. Access to an improved water source is equated with connection to a supply system; it does not take into account variations in the quality and cost (broadly defined) of the service.

Definitions

- Internal renewable freshwater resources are the average annual flows of rivers and groundwater from rainfall) in the country. Natural incoming flows originating outside a country's borders are excluded. Overlapping water resources between surface runoff and groundwater recharge are also deducted.
- · Renewable internal freshwater resources per capita are calculated using the World Bank's population estimates (see table 2.1). • Annual freshwater withdrawals are total water withdrawals, not counting evaporation losses from storage basins. Withdrawals also include water from desalination plants in countries where they are a significant source. Withdrawals can exceed 100 percent of total renewable resources where extraction from nonrenewable aquifers or desalination plants is considerable or where water reuse is significant. Withdrawals for agriculture and industry are total withdrawals for irrigation and livestock production and for direct industrial use (including for cooling thermoelectric plants). Withdrawals for domestic uses include drinking water, municipal use or supply, and use for public services, commercial establishments, and homes. • Water productivity is calculated as GDP in constant prices divided by annual total water withdrawal. • Access to an improved water source is the percentage of the population with reasonable access to an adequate amount of water from an improved source, such as piped water into a dwelling, plot, or yard; public tap or standpipe; tubewell or borehole; protected dug well or spring; and rainwater collection. Unimproved sources include unprotected dug wells or springs, carts with small tank or drum, bottled water, and tanker trucks. Reasonable access is defined as the availability of at least 20 liters a person a day from a source within 1 kilometer of the dwelling.

Data sources

Data on freshwater resources and withdrawals are from the Food and Agriculture Organization of the United Nations AQUASTAT data. The GDP estimates used to calculate water productivity are from the World Bank national accounts database. Data on access to water are from WHO and UNICEF's Progress on Drinking Water and Sanitation (2008).

a. Data are derived using the United Nations Industrial Development Organization's (UNIDO) industry database four-digit International Standard Industrial Classification (ISIC). Data in italics are for the most recent year available and are derived using UNIDO's industry database at the three-digit ISIC.

About the data

Emissions of organic pollutants from industrial activities are a major cause of degradation of water quality. Water quality and pollution levels are generally measured as concentration or load—the rate of occurrence of a substance in an aqueous solution. Polluting substances include organic matter, metals, minerals, sediment, bacteria, and toxic chemicals. The table focuses on organic water pollution resulting from industrial activities. Because water pollution tends to be sensitive to local conditions, the national-level data in the table may not reflect the quality of water in specific locations.

The data in the table come from an international study of industrial emissions that may have been the first to include data from developing countries (Hettige, Mani, and Wheeler 1998). These data were updated through 2006 by the World Bank's Development Research Group. Unlike estimates from earlier studies based on engineering or economic models, these estimates are based on actual measurements of plant-level water pollution. The focus is on organic water pollution caused by organic waste, measured in terms of biochemical oxygen demand (BOD), because the data for this indicator are the most plentiful and reliable for cross-country comparisons of emissions. BOD measures the strength of an organic waste by the amount of oxygen consumed in breaking it down. A sewage overload in natural waters exhausts the water's dissolved oxygen content. Wastewater treatment, by contrast, reduces BOD.

Data on water pollution are more readily available than are other emissions data because most industrial pollution control programs start by regulating emissions of organic water pollutants. Such data are fairly reliable because sampling techniques for measuring water pollution are more widely understood and much less expensive than those for air

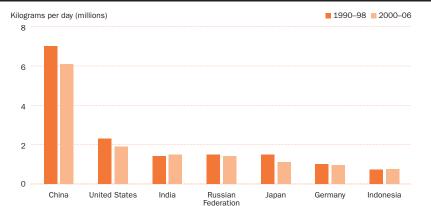

Hettige, Mani, and Wheeler (1998) used plant- and sector-level information on emissions and employment from 13 national environmental protection agencies and sector-level information on output and employment from the United Nations Industrial Development Organization (UNIDO). Their econometric analysis found that the ratio of BOD to employment in each industrial sector is about the same across countries. This finding allowed the authors to estimate BOD loads across countries and over time. The estimated BOD intensities per unit of employment were multiplied by sectoral employment numbers from UNIDO's industry database for 1980-98. These estimates of sectoral emissions were then used to calculate kilograms of emissions of organic water pollutants per day for each country and year. The data in the table were derived by updating these estimates through 2006.

Definitions

Water pollution

· Emissions of organic water pollutants are measured as biochemical oxygen demand, or the amount of oxygen that bacteria in water will consume in breaking down waste, a standard water treatment test for the presence of organic pollutants. Emissions per worker are total emissions divided by the number of industrial workers. . Industry shares of emissions of organic water pollutants are emissions from manufacturing activities as defined by two-digit divisions of the International Standard Industrial Classification revision 3.

Emissions of organic water pollutants declined in most economies from 1990 to 2006, 3.6a even in some of the top emitters

Note: Data are for the most recent year available during the period specified. Source: Table 3.6.

Data sources

Data on water pollutants are from Hettige, Mani, and Wheeler, "Industrial Pollution in Economic Development: Kuznets Revisited" (1998). The data were updated through 2006 by the World Bank's Development Research Group using the same methodology as the initial study. Data on industrial sectoral employment are from UNIDO's industry database.

Energy production and use

About the data

In developing economies growth in energy use is closely related to growth in the modern sectors—industry, motorized transport, and urban areas—but energy use also reflects climatic, geographic, and economic factors (such as the relative price of energy). Energy use has been growing rapidly in low- and middle-income economies, but high-income economies still use almost five times as much energy on a per capita basis.

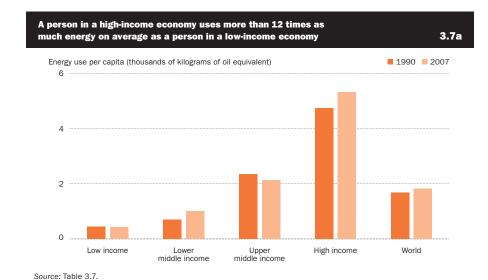

Energy data are compiled by the International Energy Agency (IEA). IEA data for economies that are not members of the Organisation for Economic Co-operation and Development (OECD) are based on national energy data adjusted to conform to annual questionnaires completed by OECD member governments.

Total energy use refers to the use of primary energy before transformation to other end-use fuels (such as electricity and refined petroleum products). It includes energy from combustible renewables and waste—solid biomass and animal products, gas and liquid from biomass, and industrial and municipal waste. Biomass is any plant matter used directly as fuel or converted into fuel, heat, or electricity. Data for combustible renewables and waste are often based on small surveys or other incomplete information and thus give only a broad impression of developments and are not strictly comparable across countries. The IEA reports include country notes that explain some of these differences (see Data sources). All forms of energy—primary energy and primary electricity—are converted into oil equivalents. A notional thermal efficiency of 33 percent is assumed for converting nuclear electricity into oil equivalents and 100 percent efficiency for converting hydroelectric power.

The IEA makes these estimates in consultation with national statistical offices, oil companies, electric utilities, and national energy experts. The IEA occasionally revises its time series to reflect political changes, and energy statistics undergo continual changes in coverage or methodology as more detailed energy accounts become available. Breaks in series are therefore unavoidable.

Definitions

. Energy production refers to forms of primary energy-petroleum (crude oil, natural gas liquids, and oil from nonconventional sources), natural gas, solid fuels (coal, lignite, and other derived fuels), and combustible renewables and waste-and primary electricity, all converted into oil equivalents (see About the data). • Energy use refers to the use of primary energy before transformation to other end-use fuels, which is equal to indigenous production plus imports and stock changes, minus exports and fuels supplied to ships and aircraft engaged in international transport (see About the data). • Fossil fuel comprises coal, oil, petroleum, and natural gas products. • Combustible renewables and waste comprise solid biomass, liquid biomass, biogas, industrial waste, and municipal waste. • Alternative and nuclear energy production is noncarbohydrate energy that does not produce carbon dioxide when generated. It includes hydropower and nuclear, geothermal, and solar power, among others.

Data sources

Data on energy production and use are from IEA electronic files and are published in IEA's annual publications, *Energy Statistics and Balances of Non-OECD Countries*, *Energy Statistics of OECD Countries*, and *Energy Balances of OECD Countries*.

a. Negative values indicate that a country is a net exporter. b. Deviation from zero is due to statistical errors and changes in stock. c. Includes emissions not allocated to specific countries.

About the data

Because commercial energy is widely traded, its production and use need to be distinguished. Net energy imports show the extent to which an economy's use exceeds its production. High-income economies are net energy importers; middle-income economies are their main suppliers.

The ratio of gross domestic product (GDP) to energy use indicates energy efficiency. To produce comparable and consistent estimates of real GDP across economies relative to physical inputs to GDP—that is, units of energy use—GDP is converted to 2005 international dollars using purchasing power parity (PPP) rates. Differences in this ratio over time and across economies reflect structural changes in an economy, changes in sectoral energy efficiency, and differences in fuel mixes.

Carbon dioxide emissions, largely by-products of energy production and use (see table 3.7), account for the largest share of greenhouse gases, which are associated with global warming. Anthropogenic carbon dioxide emissions result primarily from fossil fuel combustion and cement manufacturing. In

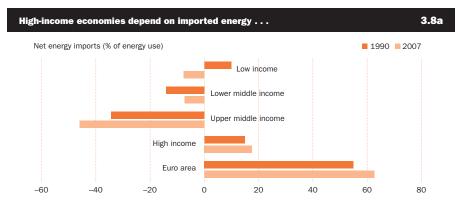

combustion different fossil fuels release different amounts of carbon dioxide for the same level of energy use: oil releases about 50 percent more carbon dioxide than natural gas, and coal releases about twice as much. Cement manufacturing releases about half a metric ton of carbon dioxide for each metric ton of cement produced.

The U.S. Department of Energy's Carbon Dioxide Information Analysis Center (CDIAC) calculates annual anthropogenic emissions from data on fossil fuel consumption (from the United Nations Statistics Division's World Energy Data Set) and world cement manufacturing (from the U.S. Bureau of Mines's Cement Manufacturing Data Set). Carbon dioxide emissions, often calculated and reported as elemental carbon, were converted to actual carbon dioxide mass by multiplying them by 3.664 (the ratio of the mass of carbon to that of carbon dioxide). Although estimates of global carbon dioxide emissions are probably accurate within 10 percent (as calculated from global average fuel chemistry and use), country estimates may have larger error bounds. Trends

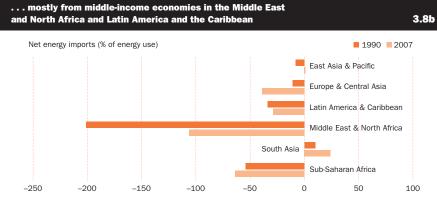

estimated from a consistent time series tend to be more accurate than individual values. Each year the CDIAC recalculates the entire time series since 1949, incorporating recent findings and corrections. Estimates exclude fuels supplied to ships and aircraft in international transport because of the difficulty of apportioning the fuels among benefiting countries. The ratio of carbon dioxide per unit of energy shows carbon intensity, which is the amount of carbon dioxide emitted as a result of using one unit of energy in the process of production. The proportion of carbon dioxide per unit of GDP indicates how clean production processes are.

Definitions

- Net energy imports are estimated as energy use less production, both measured in oil equivalents.
- · GDP per unit of energy use is the ratio of gross domestic product (GDP) per kilogram of oil equivalent of energy use, with GDP converted to 2005 international dollars using purchasing power parity (PPP) rates. An international dollar has the same purchasing power over GDP that a U.S. dollar has in the United States. Energy use refers to the use of primary energy before transformation to other end-use fuel, which is equal to indigenous production plus imports and stock changes minus exports and fuel supplied to ships and aircraft engaged in international transport (see About the data for table 3.7) • Carbon dioxide emissions are emissions from the burning of fossil fuels and the manufacture of cement and include carbon dioxide produced during consumption of solid, liquid, and gas fuels and gas flaring.

Note: Negative values indicate that the income group is a net energy exporter. Source: Table 3.8.

Note: Negative values indicate that the region is a net energy exporter. Source: Table 3.8.

Data sources

Data on energy use are from the electronic files of the International Energy Agency. Data on carbon dioxide emissions are from the CDIAC, Environmental Sciences Division, Oak Ridge National Laboratory, Tennessee, United States.

a. Calculated using the least squares method, which accounts for ups and downs of all data points in the period (see Statistical methods). b. Calculated as the change in emission since 1990, which is the baseline for Kyoto Protocol requirements. c. Includes Kosovo and Montenegro.

3.9

Trends in greenhouse gas emissions

About the data

Greenhouse gases—which include carbon dioxide, methane, nitrous oxide, hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride—contribute to climate change.

Carbon dioxide emissions, largely a byproduct of energy production and use (see table 3.7), account for the largest share of greenhouse gases. Anthropogenic carbon dioxide emissions result primarily from fossil fuel combustion and cement manufacturing. Burning oil releases more carbon dioxide than burning natural gas, and burning coal releases even more for the same level of energy use. Cement manufacturing releases about half a metric ton of carbon dioxide for each metric ton of cement produced.

Methane emissions result largely from agricultural activities, industrial production landfills and wastewater treatment, and other sources such as tropical forest and other vegetation fires. The emissions are usually expressed in carbon dioxide equivalents using the global warming potential, which allows the effective contributions of different gases to be

compared. A kilogram of methane is 21 times as effective at trapping heat in the earth's atmosphere as a kilogram of carbon dioxide within 100 years.

Nitrous oxide emissions are mainly from fossil fuel combustion, fertilizers, rainforest fires, and animal waste. Nitrous oxide is a powerful greenhouse gas, with an estimated atmospheric lifetime of 114 years, compared with 12 years for methane. The per kilogram global warming potential of nitrous oxide is nearly 310 times that of carbon dioxide within 100 years.

Other greenhouse gases covered under the Kyoto Protocol are hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride. Although emissions of these artificial gases are small, they are more powerful greenhouse gases than carbon dioxide, with much higher atmospheric lifetimes and high global warming potential.

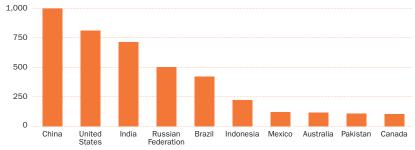

For a discussion of carbon dioxide sources and the methodology behind emissions calculation, see *About the data* for table 3.8.

Definitions

· Carbon dioxide emissions are emissions from the burning of fossil fuels and the manufacture of cement and include carbon dioxide produced during consumption of solid, liquid, and gas fuels and gas flaring. • Methane emissions are emissions from human activities such as agriculture and from industrial methane production. • Methane emissions from energy processes are emissions from the production, handling, transmission, and combustion of fossil fuels and biofuels. • Agricultural methane emissions are emissions from animals, animal waste, rice production, agricultural waste burning (nonenergy, on-site), and savannah burning. . Nitrous oxide emissions are emissions from agricultural biomass burning, industrial activities, and livestock management. • Nitrous oxide emissions from energy processes are emissions produced by the combustion of fossil fuels and biofuels. . Agricultural nitrous oxide emissions are emissions produced through fertilizer use (synthetic and animal manure), animal waste management, agricultural waste burning (nonenergy, on-site), and savannah burning. • Other greenhouse gas emissions are byproduct emissions of hydrofluorocarbons (byproduct emissions of fluoroform from chlorodifluoromethane manufacture and use of hydrofluorocarbons), perfluoro carbons (byproduct emissions of tetrafluoromethane and hexafluoroethane from primary aluminum production and use of perfluoro carbons, in particular for semiconductor manufacturing), and sulfur hexafluoride (various sources, the largest being the use and manufacture of gas insulated switchgear used in electricity distribution networks).

Methane emissions, 2005 (million metric tons of carbon dioxide equivalent)

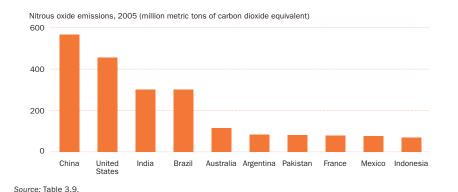

Source: Table 3.9.

The 10 largest contributors to nitrous oxide emissions account for about 56 percent of emissions

3.9b

3.9a

Data sources

Data on carbon dioxide emissions are from the Carbon Dioxide Information Analysis Center, Environmental Sciences Division, Oak Ridge National Laboratory, Tennessee, United States. Data on methane, nitrous oxide, and other greenhouse gases emissions are compiled by the International Energy Agency.

a. Shares may not sum to 100 percent because some sources of generated electricity (such as wind, solar, and geothermal) are not shown. b. Includes Kosovo and Montenegro.

About the data

Use of energy is important in improving people's standard of living. But electricity generation also can damage the environment. Whether such damage occurs depends largely on how electricity is generated. For example, burning coal releases twice as much carbon dioxide—a major contributor to global warming—as does burning an equivalent amount of natural gas (see *About the data* for table 3.8). Nuclear energy does not generate carbon dioxide emissions, but it produces other dangerous waste products. The table provides information on electricity production by source.

The International Energy Agency (IEA) compiles data on energy inputs used to generate electricity. IEA data for countries that are not members of the Organisation for Economic Co-operation and Development (OECD) are based on national energy data adjusted to conform to annual questionnaires completed by OECD member governments. In addition, estimates are sometimes made to complete major aggregates from which key data are missing, and

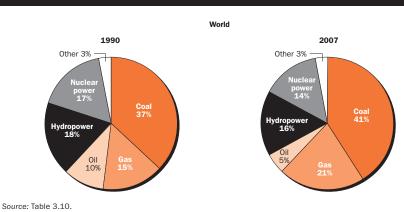

adjustments are made to compensate for differences in definitions. The IEA makes these estimates in consultation with national statistical offices, oil companies, electric utilities, and national energy experts. It occasionally revises its time series to reflect political changes. For example, the IEA has constructed historical energy statistics for countries of the former Soviet Union. In addition, energy statistics for other countries have undergone continuous changes in coverage or methodology in recent years as more detailed energy accounts have become available. Breaks in series are therefore unavoidable.

Definitions

· Electricity production is measured at the terminals of all alternator sets in a station. In addition to hydropower, coal, oil, gas, and nuclear power generation, it covers generation by geothermal, solar, wind, and tide and wave energy as well as that from combustible renewables and waste. Production includes the output of electric plants designed to produce electricity only, as well as that of combined heat and power plants. • Sources of electricity are the inputs used to generate electricity: coal, gas, oil, hydropower, and nuclear power. • Coal is all coal and brown coal, both primary (including hard coal and lignite-brown coal) and derived fuels (including patent fuel, coke oven coke, gas coke, coke oven gas, and blast furnace gas). Peat is also included in this category. • Gas is natural gas but not natural gas liquids. • Oil is crude oil and petroleum products. • Hydropower is electricity produced by hydroelectric power plants. • Nuclear power is electricity produced by nuclear power plants.

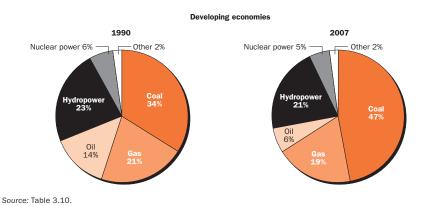

Sources of electricity generation have shifted since 1990 . . .

3.10a

... with developing economies relying more on coal

3.10b

Data sources

Data on electricity production are from the IEA's electronic files and its annual publications *Energy Statistics and Balances of Non-OECD Countries, Energy Statistics of OECD Countries, and Energy Balances of OECD Countries.*

a. Includes Kosovo.

About the data

There is no consistent and universally accepted standard for distinguishing urban from rural areas, in part because of the wide variety of situations across countries (see *About the data* for table 3.1). Most countries use an urban classification related to the size or characteristics of settlements. Some define urban areas based on the presence of certain infrastructure and services. And other countries designate urban areas based on administrative arrangements.

The population of a city or metropolitan area depends on the boundaries chosen. For example, in 1990 Beijing, China, contained 2.3 million people in 87 square kilometers of "inner city" and 5.4 million in 158 square kilometers of "core city." The population of "inner city and inner suburban districts" was 6.3 million and that of "inner city, inner and outer suburban districts, and inner and outer counties" was 10.8 million. (Most countries use the last definition.) For further discussion of urban-rural issues see box 3.1a in *About the data* for table 3.1.

Estimates of the world's urban population would change significantly if China, India, and a few other

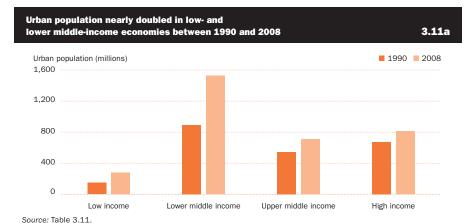

populous nations were to change their definition of urban centers. According to China's State Statistical Bureau, by the end of 1996 urban residents accounted for about 43 percent of China's population, more than double the 20 percent considered urban in 1994. In addition to the continuous migration of people from rural to urban areas, one of the main reasons for this shift was the rapid growth in the hundreds of towns reclassified as cities in recent years

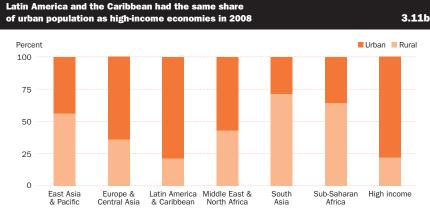

Because the estimates in the table are based on national definitions of what constitutes a city or metropolitan area, cross-country comparisons should be made with caution. To estimate urban populations, UN ratios of urban to total population were applied to the World Bank's estimates of total population (see table 2.1).

The table shows access to improved sanitation facilities for both urban and rural populations to allow comparison of access. Definitions of access and urban areas vary, however, so comparisons between countries can be misleading.

Definitions

· Urban population is the midyear population of areas defined as urban in each country and reported to the United Nations (see About the data). • Population in urban agglomerations of more than 1 million is the percentage of a country's population living in metropolitan areas that in 2005 had a population of more than 1 million. • Population in largest city is the percentage of a country's urban population living in that country's largest metropolitan area. • Access to improved sanitation facilities is the percentage of the urban or rural population with access to at least adequate excreta disposal facilities (private or shared but not public) that can effectively prevent human, animal, and insect contact with excreta. Improved facilities range from simple but protected pit latrines to flush toilets with a sewerage connection. To be effective, facilities must be correctly constructed and properly maintained.

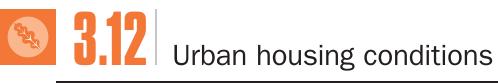

Source: Tables 3.1 and 3.11.

Data sources

Data on urban population and the population in urban agglomerations and in the largest city are from the United Nations Population Division's World Urbanization Prospects: The 2007 Revision. Data on total population are World Bank estimates. Data on access to sanitation are from the World Health Organization and United Nations Children's Fund's Progress on Drinking Water and Sanitation (2008).

a. More than two people per room. b. Data are from a previous census.

Urbanization can yield important social benefits, improving access to public services and the job market. It also leads to significant demands for services. Inadequate living quarters and demand for housing and shelter are major concerns for policymakers.

The unmet demand for affordable housing, along with urban poverty, has led to the emergence of slums in many poor countries. Improving the shelter situation requires a better understanding of the mechanisms governing housing markets and the processes governing housing availability. That requires good data and adequate policy-oriented analysis so that housing policy can be formulated in a global comparative perspective and drawn from lessons learned in other countries. Housing policies and outcomes affect such broad socioeconomic conditions as the infant mortality rate, performance in school, household saving, productivity levels, capital formation, and government budget deficits. A good understanding of housing conditions thus requires an extensive set of indicators within a reasonable There is a strong demand for quantitative indicators that can measure housing conditions on a regular basis to monitor progress. However, data deficiencies and lack of rigorous quantitative analysis hamper informed decisionmaking on desirable policies to improve housing conditions. The data in the table are from housing and population censuses, collected using similar definitions. The table will incorporate household survey data in future editions. The table focuses attention on urban areas, where housing conditions are typically most severe. Not all the compiled indicators are presented in the table because of space limitations.

Selected housing indicators for smaller economies

a. More than two people per room. b. Data are from a previous census. Source: National population and housing censuses.

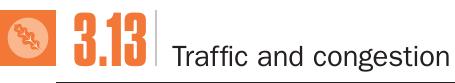

Definitions

. Census year is the year in which the underlying data were collected. • Household size is the average number of people within a household, calculated by dividing total population by the number of households in the country and in urban areas. • Overcrowding refers to the number of households living in dwellings with two or more people per room as a percentage of total households in the country and in urban areas. • Durable dwelling units are the number of housing units in structures made of durable building materials (concrete, stone, cement, brick, asbestos, zinc, and stucco) expected to maintain their stability for 20 years or longer under local conditions with normal maintenance and repair, taking into account location and environmental hazards such as floods, mudslides, and earthquakes, as a percentage of total dwellings. • Home ownership refers to the number of privately owned dwellings as a percentage of total dwellings. When the number of private dwellings is not available from the census data, the share of households that own their housing unit is used. Privately owned and owner-occupied units are included, depending on the definition used in the census data. State- and community-owned units and rented, squatted, and rent-free units are excluded. · Multiunit dwellings are the number of multiunit dwellings, such as apartments, flats, condominiums, barracks, boardinghouses, orphanages, retirement houses, hostels, hotels, and collective dwellings, as a percentage of total dwellings. . Vacancy rate is the percentage of completed dwelling units that are currently unoccupied. It includes all vacant units, whether on the market or not (such as second

Data sources

homes).

Data on urban housing conditions are from national population and housing censuses.

a. \$1.12 for consumption below 120 liters a month. b. Includes Montenegro. c. Data are from the U.S. Federal Highway Administration. d. Excludes personal passenger vans, passenger minivans, and utility-type vehicles, which are all treated as trucks. e. Data are from the European Commission and the European Road Federation.

Traffic and congestion

About the data

Traffic congestion in urban areas constrains economic productivity, damages people's health, and degrades the quality of life. In recent years ownership of passenger cars has increased, and the expansion of economic activity has led to more goods and services being transported by road over greater distances (see table 5.10). These developments have increased demand for roads and vehicles, adding to urban congestion, air pollution, health hazards, and traffic accidents and injuries. Congestion, the most visible cost of expanding vehicle ownership, is reflected in the indicators in the table. Other relevant indicators—such as average vehicle speed and the economic cost of traffic congestion—are not included because data are incomplete or difficult to compare.

The data in the table—except those on fuel prices and particulate matter—are compiled by the International Road Federation (IRF) through questionnaires sent to national organizations. Primary sources are national road associations. If they lack data or do not respond, other agencies are contacted, including road directorates, ministries of transport or public works, and central statistical offices. As a result, data quality is uneven. Coverage of each indicator may differ across countries because of different definitions. The IRF is taking steps to improve the quality of the data in its World Road Statistics 2009. Because this effort covers only 2002-07, time series data may not be comparable. Another reason is coverage. For example, the 2005 estimate for U.S. passenger cars from the U.S. Federal Highway Administration excludes personal passenger vans, passenger minivans, and utility-type vehicles. Road density is a rough indicator of accessibility and does not capture road width, type, or condition. Thus comparisons over time and across countries require caution.

Road sector energy consumption includes energy from petroleum products, natural gas, renewable and combustible waste, and electricity. Biodiesel and biogasoline, forms of renewable energy, are biodegradable and emit less sulfur and carbon monoxide than petroleum-derived fuels. They can be produced from vegetable oils, such as soybean, corn, palm, peanut, or sunflower oil, and can be used directly only in a modified internal combustion engine.

Data on fuel prices are compiled by the German Agency for Technical Cooperation (GTZ), from its global network and other sources, including the Allgemeiner Deutscher Automobile Club (for Europe) and the Latin American Energy Organization (for Latin America). Local prices are converted to U.S. dollars using the exchange rate in the *Financial Times* international monetary table on the survey date. When multiple exchange rates exist, the market, parallel, or black market rate is used. Prices were compiled in mid-November 2008, when crude oil prices had dropped to \$48 a barrel Brent (from a high of \$148).

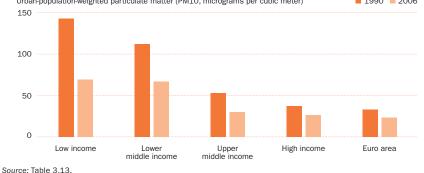

Considerable uncertainty surrounds estimates of particulate matter concentrations, and caution should be used in interpreting them. They allow for cross-country comparisons of the relative risk of particulate matter pollution facing urban residents. Major sources of urban outdoor particulate matter pollution are traffic and industrial emissions, but nonanthropogenic sources such as dust storms may be a substantial contributor for some cities. Country technology and pollution controls are important determinants of particulate matter. Data on particulate matter for selected cities are in table 3.14. Estimates of economic damages from death and illness due to particulate matter pollution are in table 3.16.

Definitions

· Motor vehicles include cars, buses, and freight vehicles but not two-wheelers. Population figures are midyear population in the year for which data are available. Roads refer to motorways (a road designed and built for motor traffic that separates the traffic flowing in opposite directions), highways, main or national roads, and secondary or regional roads. • Passenger cars are road motor vehicles, other than two-wheelers, intended for the carriage of passengers and designed to seat no more than nine people (including the driver). • Road density is the ratio of the length of the country's total road network to the country's land area. It includes all roads in the country-motorways, highways, main or national roads, secondary or regional roads, and other urban and rural roads. • Road sector energy consumption is the total energy used in the road sector from all sources, including energy from petroleum products, natural gas, combustible and renewable waste, and electricity (see table 3.7). • Gasoline is light hydrocarbon oil use in internal combustion engines such as motor vehicles, excluding aircraft.

- **Diesel** is heavy oils used as a fuel for internal combustion in diesel engines and heating installations.
- Fuel price is the pump price of super grade gasoline (usually 95 octane) and diesel fuel, converted from the local currency to U.S. dollars (see About the data). Particulate matter concentration is fine suspended particulates of less than 10 microns in diameter (PM10) that are capable of penetrating deep into the respiratory tract and causing severe health damage. Data are urban-population-weighted PM10 levels in residential areas of cities with more than 100,000 residents. The estimates represent the average annual exposure level of the average urban resident to outdoor particulate matter.

Particulate matter concentration has fallen in all income groups, and the higher the income, the lower the concentration 3.13a Urban-population-weighted particulate matter (PM10, micrograms per cubic meter)

Data sources

Data on vehicles and road density are from the IRF's electronic files and its annual *World Road Statistics*, except where noted. Data on road sector energy consumption are from the IRF and the International Energy Agency. Data on fuel prices are from the GTZ's electronic files. Data on particulate matter concentrations are from Pandey and others' "Ambient Particulate Matter Concentrations in Residential and Pollution Hotspot Areas of World Cities: New Estimates Based on the Global Model of Ambient Particulates (GMAPS)" (2006b).

About the data

Indoor and outdoor air pollution place a major burden on world health. More than half the world's people rely on dung, wood, crop waste, or coal to meet basic energy needs. Cooking and heating with these fuels on open fires or stoves without chimneys lead to indoor air pollution, which is responsible for 1.6 million deaths a year—one every 20 seconds. In many urban areas air pollution exposure is the main environmental threat to health. Long-term exposure to high levels of soot and small particles contributes to a range of health effects, including respiratory diseases, lung cancer, and heart disease. Particulate pollution, alone or with sulfur dioxide, creates an enormous burden of ill health.

Sulfur dioxide and nitrogen dioxide emissions lead to deposition of acid rain and other acidic compounds over long distances, which can lead to the leaching of trace minerals and nutrients critical to trees and plants. Sulfur dioxide emissions can damage human health, particularly that of the young and old. Nitrogen dioxide is emitted by bacteria, motor vehicles, industrial activities, nitrogen fertilizers, fuel and biomass combustion, and aerobic decomposition of organic matter in soils and oceans.

Where coal is the primary fuel for power plants without effective dust controls, steel mills, industrial boilers, and domestic heating, high levels of urban air pollution are common—especially particulates and sulfur dioxide. Elsewhere the worst emissions are from petroleum product combustion.

Sulfur dioxide and nitrogen dioxide concentration data are based on average observed concentrations at urban monitoring sites, which not all cities have.

The data on particulate matter are estimated average annual concentrations in residential areas away from air pollution "hotspots," such as industrial districts and transport corridors. The data are from the World Bank's Development Research Group and Environment Department estimates of annual ambient concentrations of particulate matter in cities with populations exceeding 100,000 (Pandey and others 2006b). A country's technology and pollution controls are important determinants of particulate matter concentrations.

Pollutant concentrations are sensitive to local conditions, and even monitoring sites in the same city may register different levels. Thus these data should be considered only a general indication of air quality, and comparisons should be made with caution. Current World Health Organization (WHO) air quality guidelines are annual mean concentrations of 20 micrograms per cubic meter for particulate matter less than 10 microns in diameter and 40 micrograms for nitrogen dioxide and daily mean concentrations of 20 micrograms per cubic meter for sulfur dioxide.

a. Data are for the most recent year available.

Definitions

• City population is the number of residents of the city or metropolitan area as defined by national authorities and reported to the United Nations. • Particulate matter concentration is fine suspended particulates of less than 10 microns in diameter (PM10) that are capable of penetrating deep into the respiratory tract and causing significant health damage. Data are urban-population-weighted PM10 levels in residential areas of cities with more than 100,000 residents. The estimates represent the average annual exposure level of the average urban resident to outdoor particulate matter. • Sulfur dioxide is an air pollutant produced when fossil fuels containing sulfur are burned. • Nitrogen dioxide is a poisonous, pungent gas formed when nitric oxide combines with hydrocarbons and sunlight, producing a photochemical reaction. These conditions occur in both natural and anthropogenic activities.

Data sources

Data on city population are from the United Nations Population Division. Data on particulate matter concentrations are from Pandey and others' "Ambient Particulate Matter Concentration in Residential and Pollution Hotspot Areas of World Cities: New Estimates Based on the Global Model of Ambient Particulates (GMAPS)" (2006b). Data on sulfur dioxide and nitrogen dioxide concentrations are from the WHO's Healthy Cities Air Management Information System and the World Resources Institute.

a. Ratification of the treaty. b. Year the treaty entered into force in the country. c. Convention became effective November 16, 1994. d. Accession. e. Acceptance. f. Approval. g. Succession. h. Signed by Serbia and Montenegro as a unified country before Montenegro declared its independence.

Government commitment

About the data

National environmental strategies and participation in international treaties on environmental issues provide some evidence of government commitment to sound environmental management. But the signing of these treaties does not always imply ratification, nor does it guarantee that governments will comply with treaty obligations.

In many countries efforts to halt environmental degradation have failed, primarily because governments have neglected to make this issue a priority, a reflection of competing claims on scarce resources. To address this problem, many countries are preparing national environmental strategies—some focusing narrowly on environmental issues, and others integrating environmental, economic, and social concerns. Among such initiatives are conservation strategies and environmental action plans. Some countries have also prepared country environmental profiles and biodiversity strategies and profiles.

National conservation strategies—promoted by the World Conservation Union (IUCN)—provide a comprehensive, cross-sectoral analysis of conservation and resource management issues to help integrate environmental concerns with the development process. Such strategies discuss current and future needs, institutional capabilities, prevailing technical conditions, and the status of natural resources in a country.

National environmental action plans, supported by the World Bank and other development agencies, describe a country's main environmental concerns, identify the principal causes of environmental problems, and formulate policies and actions to deal with them. These plans are a continuing process in which governments develop comprehensive environmental policies, recommend specific actions, and outline the investment strategies, legislation, and institutional arrangements required to implement them.

Biodiversity profiles—prepared by the World Conservation Monitoring Centre and the IUCN—provide basic background on species diversity, protected areas, major ecosystems and habitat types, and legislative and administrative support. In an effort to establish a scientific baseline for measuring progress in biodiversity conservation, the United Nations Environment Programme (UNEP) coordinates global biodiversity assessments.

To address global issues, many governments have also signed international treaties and agreements launched in the wake of the 1972 United Nations Conference on the Human Environment in Stockholm and the 1992 United Nations Conference on Environment and Development (the Earth Summit) in Rio de Janeiro, which produced Agenda 21—an array of actions to address environmental challenges:

- The Framework Convention on Climate Change aims to stabilize atmospheric concentrations of greenhouse gases at levels that will prevent human activities from interfering dangerously with the global climate.
- The Vienna Convention for the Protection of the Ozone Layer aims to protect human health and the environment by promoting research on the effects of changes in the ozone layer and on alternative substances (such as substitutes for chlorofluorocarbon) and technologies, monitoring the ozone layer, and taking measures to control the activities that produce adverse effects.
- The Montreal Protocol for Chlorofluorocarbon Control requires that countries help protect the earth from excessive ultraviolet radiation by cutting chlorofluorocarbon consumption by 20 percent over their 1986 level by 1994 and by 50 percent over their 1986 level by 1999, with allowances for increases in consumption by developing countries
- The United Nations Convention on the Law of the Sea, which became effective in November 1994, establishes a comprehensive legal regime for seas and oceans, establishes rules for environmental standards and enforcement provisions, and develops international rules and national legislation to prevent and control marine pollution.
- The Convention on Biological Diversity promotes conservation of biodiversity through scientific and technological cooperation among countries, access to financial and genetic resources, and transfer of ecologically sound technologies.

But 10 years after the Earth Summit in Rio de Janeiro the World Summit on Sustainable Development in Johannesburg recognized that many of the proposed actions had yet to materialize. To help developing countries comply with their obligations under these agreements, the Global Environment Facility (GEF) was created to focus on global improvement in biodiversity, climate change, international waters, and ozone layer depletion. The UNEP, United Nations Development Programme, and World Bank manage the GEF according to the policies of its governing body of country representatives. The World Bank is responsible for the GEF Trust Fund and chairs the GEF.

Definitions

· Environmental strategies or action plans provide a comprehensive analysis of conservation and resource management issues that integrate environmental concerns with development. They include national conservation strategies, environmental action plans, environmental management strategies. and sustainable development strategies. The date is the year a country adopted a strategy or action plan. • Biodiversity assessments, strategies, or action plans include biodiversity profiles (see About the data). • Participation in treaties covers nine international treaties (see About the data). • Climate change refers to the Framework Convention on Climate Change (signed in 1992). • Ozone layer refers to the Vienna Convention for the Protection of the Ozone Layer (signed in 1985). • CFC control refers to the Protocol on Substances That Deplete the Ozone Layer (the Montreal Protocol for Chlorofluorocarbon Control) (signed in 1987). • Law of the Sea refers to the United Nations Convention on the Law of the Sea (signed in 1982). • Biological diversity refers to the Convention on Biological Diversity (signed at the Earth Summit in 1992). • Kyoto Protocol refers to the protocol on climate change adopted at the third conference of the parties to the United Nations Framework Convention on Climate Change in December 1997. • CITES is the Convention on International Trade in Endangered Species of Wild Fauna and Flora, an agreement among governments to ensure that the survival of wild animals and plants is not threatened by uncontrolled exploitation. Adopted in 1973, it entered into force in 1975. • CCD is the United Nations Convention to Combat Desertification, an international convention addressing the problems of land degradation in the world's drylands. Adopted in 1994, it entered into force in 1996. • Stockholm Convention is an international legally binding instrument to protect human health and the environment from persistent organic pollutants, Adopted in 2001. it entered into force in 2004.

Data sources

Data on environmental strategies and participation in international environmental treaties are from the Secretariat of the United Nations Framework Convention on Climate Change, the Ozone Secretariat of the UNEP, the World Resources Institute, the UNEP, the Center for International Earth Science Information Network, and the United Nations Treaty Series.

a. World Bank staff estimate. b. Likely to be overestimated because mineral depletion excludes diamonds. c. Excludes particulate emissions damage.

About the data

Adjusted net savings measure the change in value of a specified set of assets, excluding capital gains. If a country's net savings are positive and the accounting includes a sufficiently broad range of assets, economic theory suggests that the present value of social welfare is increasing. Conversely, persistently negative adjusted net savings indicate that an economy is on an unsustainable path.

The table provides a check on the extent to which today's rents from a number of natural resources and changes in human capital are balanced by net savings, or this generation's bequest to future generations.

Adjusted net savings are derived from standard national accounting measures of gross savings by making four adjustments. First, estimates of capital consumption of produced assets are deducted to obtain net savings. Second, current public expenditures on education are added to net savings (in standard national accounting these expenditures are treated as consumption). Third, estimates of the depletion of a variety of natural resources are deducted to reflect the decline in asset values associated with their extraction and harvest. And fourth, deductions are made for damages from carbon dioxide and particulate emissions.

The exercise treats public education expenditures as an addition to savings. However, because of the wide variability in the effectiveness of public education expenditures, these figures cannot be construed as the value of investments in human capital. A current expenditure of \$1 on education does not necessarily yield \$1 of human capital. The calculation should also consider private education expenditure, but data are not available for a large number of countries.

While extensive, the accounting of natural resource depletion and pollution costs still has some gaps. Key estimates missing on the resource side include the value of fossil water extracted from aquifers, net depletion of fish stocks, and depletion and degradation of soils. Important pollutants affecting human health and economic assets are excluded because no internationally comparable data are widely available on damage from ground-level ozone or sulfur oxides.

Estimates of resource depletion are based on the "change in real wealth" method described in Hamilton and Ruta (2008), which estimates depletion as the ratio between the total value of the resource and the remaining reserve lifetime. The total value of the resource is the present value of current and

future rents from resource extractions. An economic rent represents an excess return to a given factor of production. Natural resources give rise to rents because they are not produced; in contrast, for produced goods and services competitive forces will expand supply until economic profits are driven to zero. For each type of resource and each country, unit resource rents are derived by taking the difference between world prices (to reflect the social opportunity cost of resource extraction) and the average unit extraction or harvest costs (including a "normal" return on capital). Unit rents are then multiplied by the physical quantity extracted or harvested to arrive at total rent. To estimate the value of the resource. rents are assumed to be constant over the life of the resource (the El Serafy approach), and the present value of the rent flow is calculated using a 4 percent social discount rate. For details on the estimation of natural wealth see World Bank (2006).

A positive net depletion figure for forest resources implies that the harvest rate exceeds the rate of natural growth; this is not the same as deforestation, which represents a change in land use (see *Definitions* for table 3.4). In principle, there should be an addition to savings in countries where growth exceeds harvest, but empirical estimates suggest that most of this net growth is in forested areas that cannot currently be exploited economically. Because the depletion estimates reflect only timber values, they ignore all the external and nontimber benefits associated with standing forests.

Pollution damage from emissions of carbon dioxide is calculated as the marginal social cost per unit multiplied by the increase in the stock of carbon dioxide. The unit damage figure represents the present value of global damage to economic assets and to human welfare over the time the unit of pollution remains in the atmosphere.

Pollution damage from particulate emissions is estimated by valuing the human health effects from exposure to particulate matter pollution in urban areas. The estimates are calculated as willingness to pay to avoid illness and death from cardiopulmonary disease and lung cancer in adults and acute respiratory infections in children that is attributable to particulate emissions.

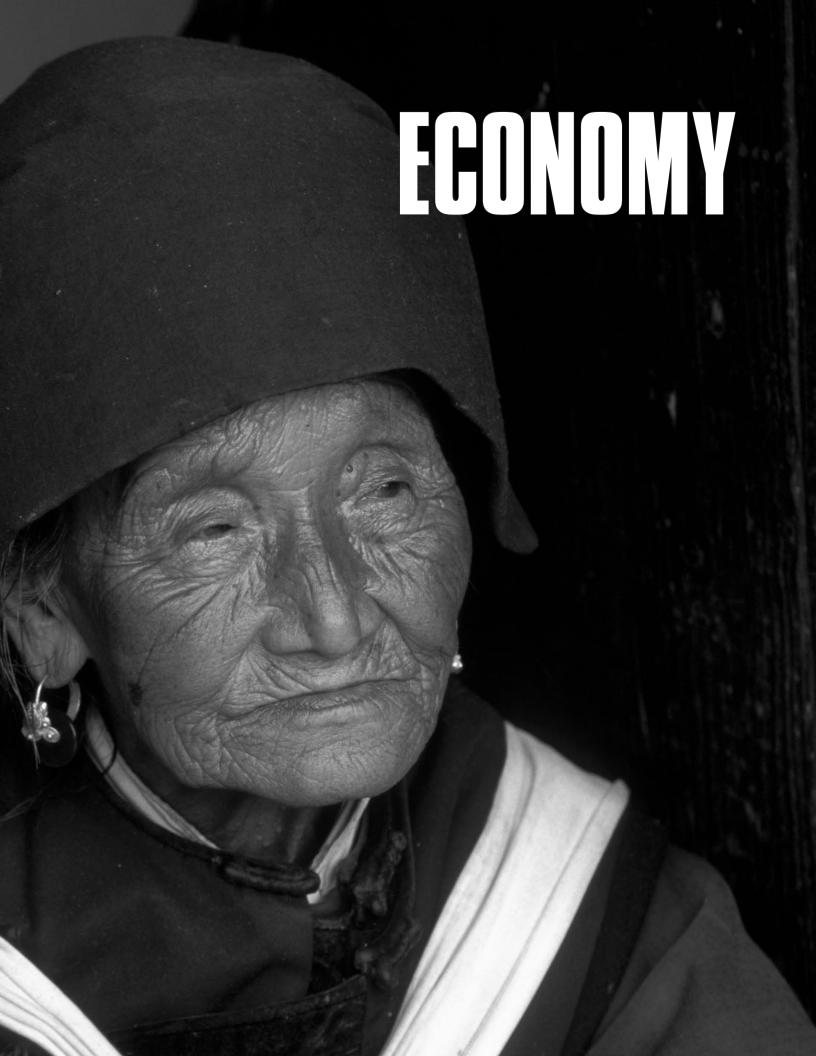

For a detailed note on methodology, see www. worldbank.org/data.

Definitions

· Gross savings are the difference between gross national income and public and private consumption, plus net current transfers. • Consumption of fixed capital is the replacement value of capital used up in production. • Net national savings are gross savings minus consumption of fixed capital. • Education expenditure is public current operating expenditures in education, including wages and salaries and excluding capital investments in buildings and equipment. • Energy depletion is the ratio of the value of the stock of energy resources to the remaining reserve lifetime (capped at 25 years). It covers coal, crude oil, and natural gas. . Mineral depletion is the ratio of the value of the stock of mineral resources to the remaining reserve lifetime (capped at 25 years). It covers tin, gold, lead, zinc, iron, copper, nickel, silver, bauxite, and phosphate. • Net forest depletion is unit resource rents times the excess of roundwood harvest over natural growth. • Carbon dioxide damage is estimated at \$20 per ton of carbon (the unit damage in 1995 U.S. dollars) times tons of carbon emitted. • Particulate emission damage is the willingness to pay to avoid illness and death attributable to particulate emissions. • Adjusted net savings are net savings plus education expenditure minus energy depletion, mineral depletion, net forest depletion, and carbon dioxide and particulate emissions damage.

Data sources

Data on gross savings are from World Bank national accounts data files (see table 4.8). Data on consumption of fixed capital are from the United Nations Statistics Division's National Accounts Statistics: Main Aggregates and Detailed Tables, 1997, extrapolated to 2008. Data on education expenditure are from the United Nations Statistics Division's Statistical Yearbook 1997 and from the United Nations Educational, Scientific, and Cultural Organization Institute for Statistics online database. Missing data are estimated by World Bank staff. Data on energy, mineral, and forest depletion are estimates based on sources and methods in Kunte and others' "Estimating National Wealth: Methodology and Results" (1998). Data on carbon dioxide damage are from Fankhauser's Valuing Climate Change: The Economics of the Greenhouse (1995). Data on particulate emission damage are from Pandey and others' "The Human Costs of Air Pollution: New Estimates for Developing Countries" (2006). The conceptual underpinnings of the savings measure appear in Hamilton and Clemens' "Genuine Savings Rates in Developing Countries" (1999).

conomic growth is not explicitly targeted in the Millennium Development Goals (MDGs), yet income per capita measures are highly correlated with widely used indicators of poverty, health, and education. As countries become richer, poverty rates generally fall (figure 4a). During 2000–08 low- and middle-income countries averaged economic growth of 6.2 percent a year, and during 1999–2005 the number of people living on less than \$1.25 a day fell by 325 million. Economic growth is clearly necessary for achieving the MDG targets.

The 2008 financial crisis and ensuing global recession have substantially increased the challenge of meeting the MDG targets. In contrast to the record growth in 2000–07, the global economy grew only 1.9 percent in 2008 and declined an estimated 2.2 percent in 2009. Some 64 million more people will be living in extreme poverty by 2010 because of the crisis. The effects on human welfare may be costly and long-lasting.

Relationship between economic growth and development outcomes

Income per capita is highly correlated with many development indicators, such as secondary school enrollment, access to water and sanitation, births attended by skilled staff, total fertility rate, children immunized against measles, malnutrition prevalence, and infant mortality. The correlation coefficients—measuring the degree of relationship—between gross national income (GNI) per capita and selected nonmonetary measures of welfare are generally high using either the *World Bank Atlas* method for calculating GNI or purchasing power parity—converted GNI (figure 4b). The highest correlation is between GNI per capita and the poverty headcount ratio (\$2 a day).

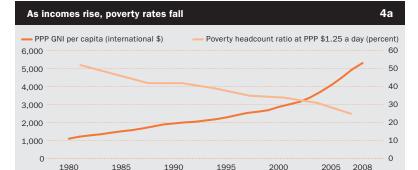

The global economy in 2009

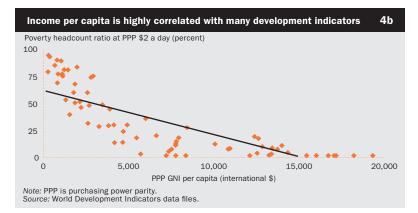

The 2008 financial crisis led to a global economic recession in 2009, the most severe in 50 years. GDP fell 3.2 percent in high-income economies and grew only 1.2 percent in developing economies (figure 4c). The effects of the crisis were transmitted from high-income economies to developing economies as exports, private capital flows, commodity prices, and workers' remittances declined.

Global trade, whose growth had slowed to 3 percent in 2008, declined an estimated 12 percent in 2009 (figure 4d). Developing economies' trade shrank an estimated 9 percent in 2009. Private capital flows to developing economies—after peaking at

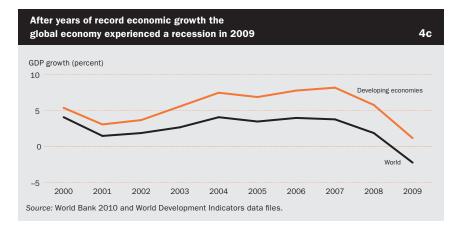

nearly \$1 trillion in 2007—dropped to \$765 billion in 2008 and are estimated to have been much lower in 2009 (figure 4e). Workers' remittances were more

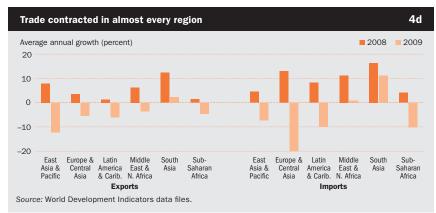

Note: PPP is purchasing power parity.
Source: World Development Indicators data files

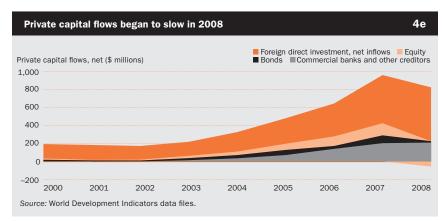

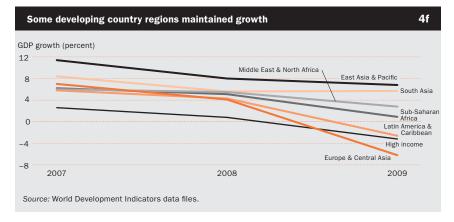

resilient—falling 6.1 percent to \$317 billion in 2009—but varied by country.

Among developing country regions Europe and Central Asia fared the worst, as GDP fell 6.2 percent (figure 4f). Severe economic adjustments were necessary as private capital flows, which had financed large current account deficits, were cut from \$97 billion in 2007 to \$50 billion in 2008. Latin America and the Caribbean economies contracted 2.6 percent, with Mexico—relying almost solely on the U.S. market for its exports—the worst off. China and India managed to continue growing at nearly the same rate as before the crisis, but other economies in Asia did not do as well. Growth in the Middle East and North Africa dropped to 2.3 percent on lower oil prices and exports to Europe.

Sub-Saharan Africa barely grew, hurt by falling export commodity prices, falling remittances, lower tourism revenues, and declining private capital flows. Home to 30 of the 43 low-income economies, Sub-Saharan Africa has been subject to the most severe consequences of the crisis. Low-income households, at risk of being pushed into poverty, have suffered from deteriorating health and lost education opportunities.

Global imbalances are easing

The structural imbalances in the global economy predating the crisis eased as the current account balances of the largest surplus and deficit economies moderated (figure 4g). The crisis has given impetus to rebalancing the economies of China and the United States. China focused on domestic sources of growth in its 11th five-year plan, and in the United States the 2010 Economic Report of the President proposed a transition from consumption-driven growth to an emphasis on investment and exports.

Consumers in high-income economies have reduced spending, and imports have declined faster than exports. In 2008 and 2009 private consumption expenditures declined in the United States.

In China imports outpaced exports, driven by domestic demand as the government increased spending on infrastructure, social programs, and environmental protection. The result: China's current account surplus dropped from its peak of 11.0 percent of GDP in 2007 to 6.6 percent in the first half of 2009. And the U.S. current account deficit was more than halved, from -6.0 percent in 2006 to -2.8 percent in the second quarter of 2009.

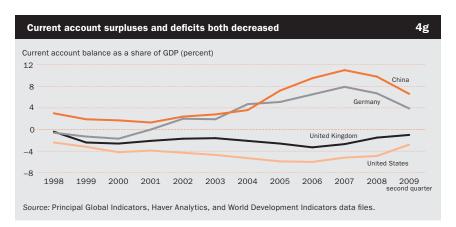

New risks have emerged

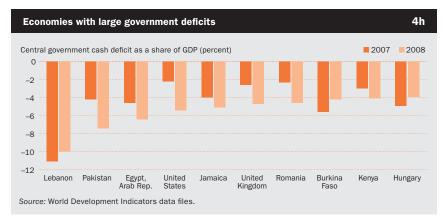

If household consumption in high-income economies continues to decline, new drivers of global economic growth will be crucial. China and India might become new drivers, but large differences between the scale and structure of their economies and of the U.S. economy will delay their replacing the U.S. role in the global economy. For example, U.S. household consumption was more than \$10 trillion in 2008, four times that of China and India combined. Developing economies have growth potential because they have room for productivity gains from increased investment. High-income economies face overcapacity that could limit recovery, but they are investing in transforming their economies through technological innovations to protect the environment and combat global warming.

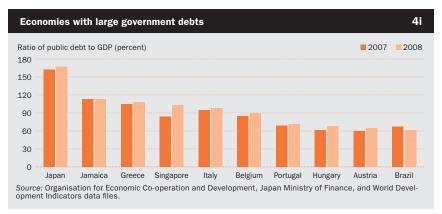

Although the world avoided the most catastrophic potential effects of the crisis, the resulting conditions require careful navigation and eventual resolution. Fiscal deficits and public debt have increased substantially in many highincome economies (figures 4h and 4i). In some cases high deficits and debt levels raised perceptions of sovereign default risk, indicated by the mounting cost of credit default swaps (figure 4j).

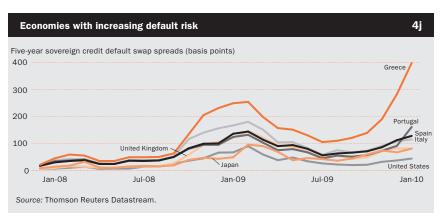

Rising public deficits and debt are accompanied by increased uncertainty in measuring risk when debt includes derivatives. Private corporations took on high levels of debt in the runup to the financial crisis. They believed—as did creditors, rating agencies, and regulators—that complex financial instruments, or derivatives, provided a hedge against default. Derivatives also play a role in public debt. For example, governments can use interest and currency swaps to raise capital in return for increased future payments. But such derivatives are not included in traditional measures of indebtedness.

Governments must maintain reasonable budget balances and debt levels to keep the confidence of taxpayers and creditors. Without fiscal credibility, creditors will refuse to continue lending. To reduce deficits, governments must raise revenues or reduce spending. Economic expansion can boost revenues through higher tax receipts, but if expansion is too slow, governments must resort to the unpopular alternatives of increasing tax rates and cutting spending—as in the United Kingdom and the United States, where buoyant revenues created by structural imbalances cannot be restored by returning to the unsustainable conditions of 2007.

Growth in GDP

Quarterly data for selected major economies in each developing country region show economic contraction in Brazil, the Russian Federation, and South Africa and slowing output in China, Egypt, and India. The contractions and slowdowns bottom out around the first quarter of 2009.

Growth in industrial production

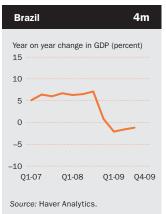

The industrial sector shrank in all the large developing countries shown here except China. The low point at the end of 2008 was followed by improvements throughout 2009.

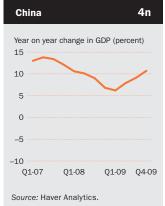

Lending and inflation rates

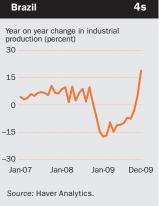

Inflation accelerated in 2008 as food and fuel prices rose but fell in 2009 with the slowdown in output. India was the exception, as food prices remained high because of drought.

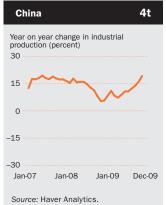

Central government debt

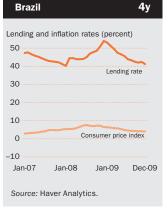

These countries have increased public spending without substantially increasing debt levels.

Source: Haver Analytics.

Merchandise trade

China's imports have declined less than exports, resulting in a smaller trade surplus. For most countries trade has declined in absolute terms as well as relative to GDP.

Equity price indexes

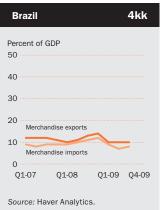

Equity prices in large developing countries have rebounded from their lows in late 2008 as investors regained confidence on growing signs of economic recovery.

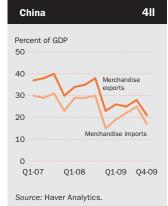

Bond spreads

The cost of borrowing for large developing countries has declined after rising in reaction to the financial crisis but remains above precrisis levels.

Financing through international capital markets

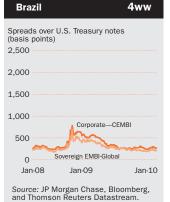

Capital flows to large developing countries rebounded somewhat in 2008 but remain below their peak levels of 2007.

a. Data are preliminary estimates. b. Private analysts estimate that consumer price index inflation was considerably higher for 2007–09 and believe that GDP volume growth has been significantly lower than official reports indicate since the last quarter of 2008.

a. Components are at producer prices. b. Private analysts estimate that consumer price index inflation was considerably higher for 2007–09 and believe that GDP volume growth has been significantly lower than official reports indicate since the last quarter of 2008. c. Covers mainland Tanzania only.

About the data

An economy's growth is measured by the change in the volume of its output or in the real incomes of its residents. The 1993 United Nations System of National Accounts (1993 SNA) offers three plausible indicators for calculating growth: the volume of gross domestic product (GDP), real gross domestic income, and real gross national income. The volume of GDP is the sum of value added, measured at constant prices, by households, government, and industries operating in the economy.

Each industry's contribution to growth in the economy's output is measured by growth in the industry's value added. In principle, value added in constant prices can be estimated by measuring the quantity of goods and services produced in a period, valuing them at an agreed set of base year prices, and subtracting the cost of intermediate inputs, also in constant prices. This double-deflation method, recommended by the 1993 SNA and its predecessors, requires detailed information on the structure of prices of inputs and outputs.

In many industries, however, value added is extrapolated from the base year using single volume indexes of outputs or, less commonly, inputs. Particularly in the services industries, including most of government, value added in constant prices is often imputed from labor inputs, such as real wages or number of employees. In the absence of well defined measures of output, measuring the growth of services remains difficult.

Moreover, technical progress can lead to improvements in production processes and in the quality of goods and services that, if not properly accounted for, can distort measures of value added and thus of growth. When inputs are used to estimate output, as for nonmarket services, unmeasured technical progress leads to underestimates of the volume of output. Similarly, unmeasured improvements in quality lead to underestimates of the value of output and value added. The result can be underestimates of growth and productivity improvement and overestimates of inflation.

Informal economic activities pose a particular measurement problem, especially in developing countries, where much economic activity is unrecorded. A complete picture of the economy requires estimating household outputs produced for home use, sales in informal markets, barter exchanges, and illicit or deliberately unreported activities. The consistency and completeness of such estimates depend on the skill and methods of the compiling statisticians.

Rebasing national accounts

When countries rebase their national accounts, they update the weights assigned to various components to better reflect current patterns of production or uses of output. The new base year should represent normal operation of the economy—it should be a year without major shocks or distortions. Some developing countries have not rebased their national accounts for many years. Using an old base year can be misleading because implicit price and volume weights become progressively less relevant and useful.

To obtain comparable series of constant price data, the World Bank rescales GDP and value added by industrial origin to a common reference year. This year's *World Development Indicators* continues to use 2000 as the reference year. Because rescaling changes the implicit weights used in forming regional and income group aggregates, aggregate growth rates in this year's edition are not comparable with those from earlier editions with different base years.

Rescaling may result in a discrepancy between the rescaled GDP and the sum of the rescaled components. Because allocating the discrepancy would cause distortions in the growth rates, the discrepancy is left unallocated. As a result, the weighted average of the growth rates of the components generally will not equal the GDP growth rate.

Computing growth rates

Growth rates of GDP and its components are calculated using the least squares method and constant price data in the local currency. Constant price U.S. dollar series are used to calculate regional and income group growth rates. Local currency series are converted to constant U.S. dollars using an exchange rate in the common reference year. The growth rates in the table are average annual compound growth rates. Methods of computing growth are described in Statistical methods.

Changes in the System of National Accounts

World Development Indicators adopted the terminology of the 1993 SNA in 2001. Although many countries continue to compile their national accounts according to the SNA version 3 (referred to as the 1968 SNA), more and more are adopting the 1993 SNA. Some low-income countries still use concepts from the even older 1953 SNA guidelines, including valuations such as factor cost, in describing major economic aggregates. Countries that use the 1993 SNA are identified in *Primary data documentation*.

Definitions

• Gross domestic product (GDP) at purchaser prices is the sum of gross value added by all resident producers in the economy plus any product taxes (less subsidies) not included in the valuation of output. It is calculated without deducting for depreciation of fabricated capital assets or for depletion and degradation of natural resources. Value added is the net output of an industry after adding up all outputs and subtracting intermediate inputs. The industrial origin of value added is determined by the International Standard Industrial Classification (ISIC) revision 3. • Agriculture is the sum of gross output less the value of intermediate input used in production for industries classified in ISIC divisions 1-5 and includes forestry and fishing. • Industry is the sum of gross output less the value of intermediate input used in production for industries classified in ISIC divisions 10-45, which cover mining, manufacturing (also reported separately), construction, electricity, water, and gas. • Manufacturing is the sum of gross output less the value of intermediate input used in production for industries classified in ISIC divisions 15-37. • Services correspond to ISIC divisions 50-99. This sector is derived as a residual (from GDP less agriculture and industry) and may not properly reflect the sum of services output, including banking and financial services. For some countries it includes product taxes (minus subsidies) and may also include statistical discrepancies.

Data sources

Data on national accounts for most developing countries are collected from national statistical organizations and central banks by visiting and resident World Bank missions. Data for high-income economies are from Organisation for Economic Co-operation and Development (OECD) data files. The World Bank rescales constant price data to a common reference year. The complete national accounts time series is available on the World Development Indicators 2010 CD-ROM. The United Nations Statistics Division publishes detailed national accounts for UN member countries in National Accounts Statistics: Main Aggregates and Detailed Tables and publishes updates in the Monthly Bulletin of Statistics.

a. Components are at producer prices. b. Covers mainland Tanzania only.

About the data

An economy's gross domestic product (GDP) represents the sum of value added by all its producers. Value added is the value of the gross output of producers less the value of intermediate goods and services consumed in production, before accounting for consumption of fixed capital in production. The United Nations System of National Accounts calls for value added to be valued at either basic prices (excluding net taxes on products) or producer prices (including net taxes on products paid by producers but excluding sales or value added taxes). Both valuations exclude transport charges that are invoiced separately by producers. Total GDP shown in the table and elsewhere in this volume is measured at purchaser prices. Value added by industry is normally measured at basic prices. When value added is measured at producer prices, this is noted in Primary data documentation and footnoted in the table.

While GDP estimates based on the production approach are generally more reliable than estimates compiled from the income or expenditure side, different countries use different definitions, methods, and reporting standards. World Bank staff review the quality of national accounts data and sometimes make adjustments to improve consistency with international guidelines. Nevertheless, significant discrepancies remain between international standards and actual practice. Many statistical offices, especially those in developing countries, face severe limitations in the resources, time, training, and budgets required to produce reliable and comprehensive series of national accounts statistics.

Data problems in measuring output

Among the difficulties faced by compilers of national accounts is the extent of unreported economic activity in the informal or secondary economy. In developing countries a large share of agricultural output is either not exchanged (because it is consumed within the household) or not exchanged for money.

Agricultural production often must be estimated indirectly, using a combination of methods involving estimates of inputs, yields, and area under cultivation. This approach sometimes leads to crude approximations that can differ from the true values over time and across crops for reasons other than climate conditions or farming techniques. Similarly, agricultural inputs that cannot easily be allocated to specific outputs are frequently "netted out" using equally crude and ad hoc approximations. For further discussion of the measurement of agricultural production, see *About the data* for table 3.3.

Ideally, industrial output should be measured through regular censuses and surveys of firms. But in most developing countries such surveys are infrequent, so earlier survey results must be extrapolated using an appropriate indicator. The choice of sampling unit, which may be the enterprise (where responses may be based on financial records) or the establishment (where production units may be recorded separately), also affects the quality of the data. Moreover, much industrial production is organized in unincorporated or owner-operated ventures that are not captured by surveys aimed at the formal sector. Even in large industries, where regular surveys are more likely, evasion of excise and other taxes and nondisclosure of income lower the estimates of value added. Such problems become more acute as countries move from state control of industry to private enterprise, because new firms and growing numbers of established firms fail to report. In accordance with the System of National Accounts, output should include all such unreported activity as well as the value of illegal activities and other unrecorded, informal, or small-scale operations. Data on these activities need to be collected using techniques other than conventional surveys of firms.

In industries dominated by large organizations and enterprises, such as public utilities, data on output, employment, and wages are usually readily available and reasonably reliable. But in the services industry the many self-employed workers and one-person businesses are sometimes difficult to locate, and they have little incentive to respond to surveys, let alone to report their full earnings. Compounding these problems are the many forms of economic activity that go unrecorded, including the work that women and children do for little or no pay. For further discussion of the problems of using national accounts data, see Srinivasan (1994) and Heston (1994).

Dollar conversion

To produce national accounts aggregates that are measured in the same standard monetary units, the value of output must be converted to a single common currency. The World Bank conventionally uses the U.S. dollar and applies the average official exchange rate reported by the International Monetary Fund for the year shown. An alternative conversion factor is applied if the official exchange rate is judged to diverge by an exceptionally large margin from the rate effectively applied to transactions in foreign currencies and traded products.

Definitions

• Gross domestic product (GDP) at purchaser prices is the sum of gross value added by all resident producers in the economy plus any product taxes (less subsidies) not included in the valuation of output. It is calculated without deducting for depreciation of fabricated assets or for depletion and degradation of natural resources. Value added is the net output of an industry after adding up all outputs and subtracting intermediate inputs. The industrial origin of value added is determined by the International Standard Industrial Classification (ISIC) revision 3. • Agriculture is the sum of gross output less the value of intermediate input used in production for industries classified in ISIC divisions 1-5 and includes forestry and fishing. • Industry is the sum of gross output less the value of intermediate input used in production for industries classified in ISIC divisions 10-45, which cover mining, manufacturing (also reported separately), construction, electricity, water, and gas. • Manufacturing is the sum of gross output less the value of intermediate input used in production for industries classified in ISIC divisions 15-37. • Services correspond to ISIC divisions 50-99. This sector is derived as a residual (from GDP less agriculture and industry) and may not properly reflect the sum of services output, including banking and financial services. For some countries it includes product taxes (minus subsidies) and may also include statistical discrepancies.

Data sources

Data on national accounts for most developing countries are collected from national statistical organizations and central banks by visiting and resident World Bank missions. Data for high-income economies are from Organisation for Economic Co-operation and Development (OECD) data files. The complete national accounts time series is available on the World Development Indicators 2010 CD-ROM. The United Nations Statistics Division publishes detailed national accounts for UN member countries in National Accounts Statistics: Main Aggregates and Detailed Tables and publishes updates in the Monthly Bulletin of Statistics.

a. Includes unallocated data. b. Covers mainland Tanzania only.

About the data

The data on the distribution of manufacturing value added by industry are provided by the United Nations Industrial Development Organization (UNIDO). UNIDO obtains the data from a variety of national and international sources, including the United Nations Statistics Division, the World Bank, the Organisation for Economic Co-operation and Development, and the International Monetary Fund. To improve comparability over time and across countries, UNIDO supplements these data with information from industrial censuses, statistics from national and international organizations, unpublished data that it collects in the field, and estimates by the UNIDO Secretariat. Nevertheless, coverage may be incomplete, particularly for the informal sector. When direct information on inputs and outputs is not available, estimates may be used, which may result in errors in industry totals. Moreover, countries use different reference periods (calendar or fiscal year) and valuation methods (basic or producer prices) to estimate value added. (See About the data for table 4.2.)

The data on manufacturing value added in U.S. dollars are from the World Bank's national accounts files and may differ from those UNIDO uses to calculate shares of value added by industry, in part because of differences in exchange rates. Thus value added in a particular industry estimated by applying the shares to total manufacturing value added will not match those from UNIDO sources. Classification of manufacturing industries in the table accords with the United Nations International Standard Industrial Classification (ISIC) revision 3. Editions of World Development Indicators prior to 2008 used revision 2, first published in 1948. Revision 3 was completed in 1989, and many countries now use it. But revision 2 is still widely used for compiling cross-country data. UNIDO has converted these data to accord with

revision 3. Concordances matching ISIC categories to national classification systems and to related systems such as the Standard International Trade Classification are available.

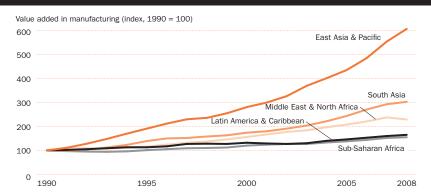

In establishing classifications systems compilers must define both the types of activities to be described and the units whose activities are to be reported. There are many possibilities, and the choices affect how the statistics can be interpreted and how useful they are in analyzing economic behavior. The ISIC emphasizes commonalities in the production process and is explicitly not intended to measure outputs (for which there is a newly developed Central Product Classification). Nevertheless, the ISIC views an activity as defined by "a process resulting in a homogeneous set of products" (United Nations 1990 [ISIC, series M, no. 4, rev. 3], p. 9).

Firms typically use multiple processes to produce a product. For example, an automobile manufacturer engages in forging, welding, and painting as well as advertising, accounting, and other service activities. Collecting data at such a detailed level is not practical, nor is it useful to record production data at the highest level of a large, multiplant, multiproduct firm. The ISIC has therefore adopted as the definition of an establishment "an enterprise or part of an enterprise which independently engages in one, or predominantly one, kind of economic activity at or from one location . . . for which data are available . . ." (United Nations 1990, p. 25). By design, this definition matches the reporting unit required for the production accounts of the United Nations System of National Accounts. The ISIC system is described in the United Nations' International Standard Industrial Classification of All Economic Activities, Third Revision (1990). The discussion of the ISIC draws on Ryten (1998).

Definitions

. Manufacturing value added is the sum of gross output less the value of intermediate inputs used in production for industries classified in ISIC major division 3. • Food, beverages, and tobacco correspond to ISIC divisions 15 and 16. • Textiles and clothing correspond to ISIC divisions 17-19. • Machinery and transport equipment correspond to ISIC divisions 29, 30, 32, 34, and 35. • Chemicals correspond to ISIC division 24. • Other manufacturing, a residual, covers wood and related products (ISIC division 20), paper and related products (ISIC divisions 21 and 22), petroleum and related products (ISIC division 23), basic metals and mineral products (ISIC division 27), fabricated metal products and professional goods (ISIC division 28), and other industries (ISIC divisions 25, 26, 31, 33, 36, and 37).

Manufacturing continues to show strong growth in East Asia through 2008

Manufacturing continues to be the dominant sector in East Asia and Pacific, growing an average of about 10.5 percent a year between 1990 and 2008.

Source: World Development Indicators data files.

Data sources

4.3a

Data on manufacturing value added are from the World Bank's national accounts files. Data used to calculate shares of industry value added are provided to the World Bank in electronic files by UNIDO. The most recent published source is UNIDO's International Yearbook of Industrial Statistics 2010.

 $\textbf{Note:} \ \textbf{Components may not sum to 100 percent because of unclassified trade. Exports of gold are excluded.}$

a. Includes Luxembourg. b. Includes re-exports. c. Refers to the South African Customs Union (Botswana, Lesotho, Namibia, South Africa, and Swaziland).

44

Structure of merchandise exports

About the data

Data on merchandise trade are from customs reports of goods moving into or out of an economy or from reports of financial transactions related to merchandise trade recorded in the balance of payments. Because of differences in timing and definitions, trade flow estimates from customs reports and balance of payments may differ. Several international agencies process trade data, each correcting unreported or misreported data, leading to other differences.

The most detailed source of data on international trade in goods is the United Nations Statistics Division's Commodity Trade (Comtrade) database. The International Monetary Fund (IMF) also collects customs-based data on trade in goods. Exports are recorded as the cost of the goods delivered to the frontier of the exporting country for shipment—the free on board (f.o.b.) value. Many countries report trade data in U.S. dollars. When countries report in local currency, the United Nations Statistics Division applies the average official exchange rate to the U.S. dollar for the period shown.

Countries may report trade according to the general or special system of trade. Under the general system exports comprise outward-moving goods that are (a) goods wholly or partly produced in the country; (b) foreign goods, neither transformed nor declared for domestic consumption in the country, that move outward from customs storage; and (c) goods previously included as imports for domestic consumption but subsequently exported without transformation. Under the special system exports comprise categories a and c. In some compilations categories b and c

are classified as re-exports. Because of differences in reporting practices, data on exports may not be fully comparable across economies.

The data on total exports of goods (merchandise) are from the World Trade Organization (WTO), which obtains data from national statistical offices and the IMF's International Financial Statistics, supplemented by the Comtrade database and publications or databases of regional organizations, specialized agencies, economic groups, and private sources (such as Eurostat, the Food and Agriculture Organization, and country reports of the Economist Intelligence Unit). Country websites and email contact have improved collection of up-to-date statistics, reducing the proportion of estimates. The WTO database now covers most major traders in Africa, Asia, and Latin America, which together with high-income countries account for nearly 95 percent of world trade. Reliability of data for countries in Europe and Central Asia has also improved.

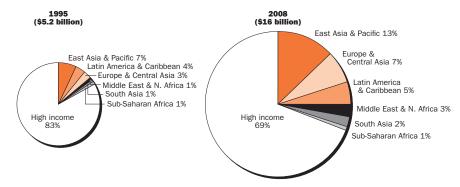

Export shares by major commodity group are from Comtrade. The values of total exports reported here have not been fully reconciled with the estimates from the national accounts or the balance of payments.

The classification of commodity groups is based on the Standard International Trade Classification (SITC) revision 3. Previous editions contained data based on the SITC revision 1. Data for earlier years in previous editions may differ because of this change in methodology. Concordance tables are available to convert data reported in one system to another.

Definitions

. Merchandise exports are the f.o.b. value of goods provided to the rest of the world. • Food corresponds to the commodities in SITC sections 0 (food and live animals), 1 (beverages and tobacco), and 4 (animal and vegetable oils and fats) and SITC division 22 (oil seeds, oil nuts, and oil kernels). • Agricultural raw materials correspond to SITC section 2 (crude materials except fuels), excluding divisions 22, 27 (crude fertilizers and minerals excluding coal, petroleum, and precious stones), and 28 (metalliferous ores and scrap). • Fuels correspond to SITC section 3 (mineral fuels). • Ores and metals correspond to the commodities in SITC divisions 27, 28, and 68 (nonferrous metals). • Manufactures correspond to the commodities in SITC sections 5 (chemicals), 6 (basic manufactures), 7 (machinery and transport equipment), and 8 (miscellaneous manufactured goods), excluding division 68.

Developing economies' share of world merchandise exports continues to expand 4.4a

Developing economies' share of world merchandise exports increased 13 percentage points from 1995 to 2008. East Asia and Pacific was the biggest gainer, capturing an additional 6 percentage points. Every region increased its share in world trade.

Data sources

Data on merchandise exports are from the WTO. Data on shares of exports by major commodity group are from Comtrade. The WTO publishes data on world trade in its Annual Report. The IMF publishes estimates of total exports of goods in its International Financial Statistics and Direction of Trade Statistics, as does the United Nations Statistics Division in its Monthly Bulletin of Statistics. And the United Nations Conference on Trade and Development publishes data on the structure of exports in its Handbook of Statistics. Tariff line records of exports are compiled in the United Nations Statistics Division's Comtrade database.

Note: Components may not sum to 100 percent because of unclassified trade.

a. Includes Luxembourg. b. Refers to the South African Customs Union (Botswana, Lesotho, Namibia, South Africa, and Swaziland).

4.5

Structure of merchandise imports

About the data

Data on imports of goods are derived from the same sources as data on exports. In principle, world exports and imports should be identical. Similarly, exports from an economy should equal the sum of imports by the rest of the world from that economy. But differences in timing and definitions result in discrepancies in reported values at all levels. For further discussion of indicators of merchandise trade, see About the data for tables 4.4 and 6.2.

The value of imports is generally recorded as the cost of the goods when purchased by the importer plus the cost of transport and insurance to the frontier of the importing country—the cost, insurance, and freight (c.i.f.) value, corresponding to the landed cost at the point of entry of foreign goods into the country. A few countries, including Australia, Canada, and the United States, collect import data on a free on board (f.o.b.) basis and adjust them for freight and insurance costs. Many countries report trade data in U.S. dollars. When countries report in local currency, the United Nations Statistics Division applies the average official exchange rate to the U.S. dollar for the period shown.

Countries may report trade according to the general or special system of trade. Under the general system imports include goods imported for domestic consumption and imports into bonded warehouses and free trade zones. Under the special system imports comprise goods imported for domestic consumption (including transformation and repair) and withdrawals for domestic consumption from bonded warehouses

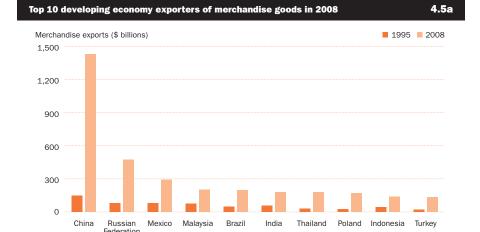

and free trade zones. Goods transported through a country en route to another are excluded.

The data on total imports of goods (merchandise) in the table come from the World Trade Organization (WTO). For further discussion of the WTO's sources and methodology, see *About the data* for table 4.4. The import shares by major commodity group are from the United Nations Statistics Division's Commodity Trade (Comtrade) database. The values of total imports reported here have not been fully reconciled with the estimates of imports of goods and services from the national accounts (shown in table 4.8) or those from the balance of payments (table 4.15).

The classification of commodity groups is based on the Standard International Trade Classification (SITC) revision 3. Previous editions contained data based on the SITC revision 1. Data for earlier years in previous editions may differ because of this change in methodology. Concordance tables are available to convert data reported in one system to another.

Definitions

. Merchandise imports are the c.i.f. value of goods purchased from the rest of the world valued in U.S. dollars. • Food corresponds to the commodities in SITC sections 0 (food and live animals), 1 (beverages and tobacco), and 4 (animal and vegetable oils and fats) and SITC division 22 (oil seeds, oil nuts, and oil kernels). • Agricultural raw materials correspond to SITC section 2 (crude materials except fuels), excluding divisions 22, 27 (crude fertilizers and minerals excluding coal, petroleum, and precious stones), and 28 (metalliferous ores and scrap). • Fuels correspond to SITC section 3 (mineral fuels). • Ores and metals correspond to the commodities in SITC divisions 27, 28, and 68 (nonferrous metals). • Manufactures correspond to the commodities in SITC sections 5 (chemicals), 6 (basic manufactures), 7 (machinery and transport equipment), and 8 (miscellaneous manufactured goods), excluding division 68.

China continues to dominate merchandise exports among developing economies. Even when developed economies are included, China ranks as the second leading merchandise exporter.

Source: World Development Indicators data files and World Trade Organization.

Data sources

Data on merchandise imports are from the WTO. Data on shares of imports by major commodity group are from Comtrade. The WTO publishes data on world trade in its *Annual Report*. The International Monetary Fund publishes estimates of total imports of goods in its *International Financial Statistics* and *Direction of Trade Statistics*, as does the United Nations Statistics Division in its *Monthly Bulletin of Statistics*. And the United Nations Conference on Trade and Development publishes data on the structure of imports in its *Handbook of Statistics*. Tariff line records of imports are compiled in the United Nations Statistics Division's Comtrade database.

Structure of service exports

About the data

Balance of payments statistics, the main source of information on international trade in services, have many weaknesses. Disaggregation of important components may be limited and varies considerably across countries. There are inconsistencies in the methods used to report items. And the recording of major flows as net items is common (for example, insurance transactions are often recorded as premiums less claims). These factors contribute to a downward bias in the value of the service trade reported in the balance of payments.

Efforts are being made to improve the coverage, quality, and consistency of these data. Eurostat and the Organisation for Economic Co-operation and Development, for example, are working together to improve the collection of statistics on trade in services in member countries. In addition, the International Monetary Fund (IMF) has implemented the new classification of trade in services introduced in the fifth edition of its *Balance of Payments Manual* (1993).

Still, difficulties in capturing all the dimensions of international trade in services mean that the record is likely to remain incomplete. Cross-border intrafirm service transactions, which are usually not captured in the balance of payments, have increased in recent years. An example is transnational corporations' use of mainframe computers around the clock for data processing, exploiting time zone differences between their home country and the host countries of their affiliates. Another important dimension of service trade not captured by conventional balance of

payments statistics is establishment trade—sales in the host country by foreign affiliates. By contrast, cross-border intrafirm transactions in merchandise may be reported as exports or imports in the balance of payments.

The data on exports of services in the table and on imports of services in table 4.7, unlike those in editions before 2000, include only commercial services and exclude the category "government services not included elsewhere." The data are compiled by the IMF based on returns from national sources. Data on total trade in goods and services from the IMF's Balance of Payments database are shown in table 4.15

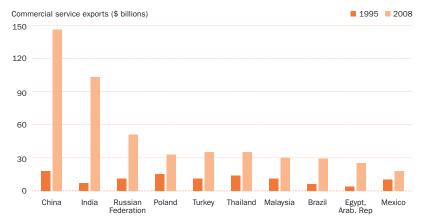

International transactions in services are defined by the IMF's *Balance of Payments Manual* (1993) as the economic output of intangible commodities that may be produced, transferred, and consumed at the same time. Definitions may vary among reporting economies. Travel services include the goods and services consumed by travelers, such as meals, lodging, and transport (within the economy visited), including car rental.

Definitions

· Commercial service exports are total service exports minus exports of government services not included elsewhere. • Transport covers all transport services (sea, air, land, internal waterway, space, and pipeline) performed by residents of one economy for those of another and involving the carriage of passengers, movement of goods (freight), rental of carriers with crew, and related support and auxiliary services. Excluded are freight insurance, which is included in insurance services; goods procured in ports by nonresident carriers and repairs of transport equipment, which are included in goods; repairs of harbors, railway facilities, and airfield facilities, which are included in construction services; and rental of carriers without crew, which is included in other services. • Travel covers goods and services acquired from an economy by travelers in that economy for their own use during visits of less than one year for business or personal purposes. • Insurance and financial services cover freight insurance on goods exported and other direct insurance such as life insurance: financial intermediation services such as commissions, foreign exchange transactions, and brokerage services; and auxiliary services such as financial market operational and regulatory services. • Computer, information, communications, and other commercial services cover such activities as international telecommunications and postal and courier services; computer data; newsrelated service transactions between residents and nonresidents: construction services: royalties and license fees: miscellaneous business, professional. and technical services; and personal, cultural, and recreational services.

Top 10 developing economy exporters of commercial services in 2008

The top 10 developing economy exporters of commercial services accounted for almost 64 percent of developing economy commercial service exports and 13 percent of world commercial service exports.

Structure of service imports

About the data

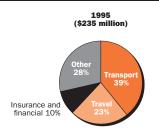

Trade in services differs from trade in goods because services are produced and consumed at the same time. Thus services to a traveler may be consumed in the producing country (for example, use of a hotel room) but are classified as imports of the traveler's country. In other cases services may be supplied from a remote location; for example, insurance services may be supplied from one location and consumed in another. For further discussion of the problems of measuring trade in services, see *About the data* for table 4.6.

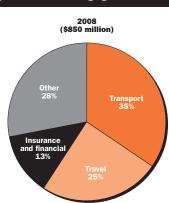

The data on imports of services in the table and on exports of services in table 4.6, unlike those in editions before 2000, include only commercial services and exclude the category "government services not included elsewhere." The data are compiled by the International Monetary Fund (IMF) based on returns from national sources.

International transactions in services are defined by the IMF's *Balance of Payments Manual* (1993) as the economic output of intangible commodities that may be produced, transferred, and consumed at the same time. Definitions may vary among reporting

Travel services include the goods and services consumed by travelers, such as meals, lodging, and transport (within the economy visited), including car rental.

The mix of commercial service imports by developing economies is changing

4.7a

Between 1995 and 2008 developing economies' commercial service imports more than tripled. Insurance and financial services and travel services are displacing transport and other services as the most important services imported.

Source: International Monetary Fund balance of payments data files.

Definitions

• Commercial service imports are total service imports minus imports of government services not included elsewhere. • Transport covers all transport services (sea, air, land, internal waterway, space, and pipeline) performed by residents of one economy for those of another and involving the carriage of passengers, movement of goods (freight), rental of carriers with crew, and related support and auxiliary services. Excluded are freight insurance, which is included in insurance services; goods procured in ports by nonresident carriers and repairs of transport equipment, which are included in goods; repairs of harbors, railway facilities, and airfield facilities, which are included in construction services; and rental of carriers without crew, which is included in other services. • Travel covers goods and services acquired from an economy by travelers in that economy for their own use during visits of less than one year for business or personal purposes. • Insurance and financial services cover freight insurance on goods imported and other direct insurance such as life insurance; financial intermediation services such as commissions, foreign exchange transactions, and brokerage services; and auxiliary services such as financial market operational and regulatory services. • Computer, information, communications, and other commercial services cover such activities as international telecommunications, and postal and courier services; computer data; newsrelated service transactions between residents and nonresidents; construction services; royalties and license fees; miscellaneous business, professional, and technical services; and personal, cultural, and recreational services.

Data sources

Data on imports of commercial services are from the IMF, which publishes balance of payments data in its *International Financial Statistics* and *Balance of Payments Statistics Yearbook*.

About the data

Gross domestic product (GDP) from the expenditure side is made up of household final consumption expenditure, general government final consumption expenditure, gross capital formation (private and public investment in fixed assets, changes in inventories, and net acquisitions of valuables), and net exports (exports minus imports) of goods and services. Such expenditures are recorded in purchaser prices and include net taxes on products.

Because policymakers have tended to focus on fostering the growth of output, and because data on production are easier to collect than data on spending, many countries generate their primary estimate of GDP using the production approach. Moreover, many countries do not estimate all the components of national expenditures but instead derive some of the main aggregates indirectly using GDP (based on the production approach) as the control total. Household final consumption expenditure (private consumption in the 1968 United Nations System of National Accounts, or SNA) is often estimated as a residual, by subtracting all other known expenditures from GDP. The resulting aggregate may incorporate fairly large discrepancies. When household consumption is calculated separately, many of the estimates are based on household surveys, which tend to be one-year studies with limited coverage. Thus the estimates quickly become outdated and must be supplemented by estimates using price- and quantity-based statistical procedures. Complicating the issue, in many developing countries the distinction between cash outlays for personal business and those for household use may be blurred. World Development Indicators includes in household consumption the expenditures of nonprofit institutions serving households.

General government final consumption expenditure (general government consumption in the 1968 SNA) includes expenditures on goods and services for individual consumption as well as those on services for collective consumption. Defense expenditures, including those on capital outlays (with certain exceptions), are treated as current spending.

Gross capital formation (gross domestic investment in the 1968 SNA) consists of outlays on additions to the economy's fixed assets plus net changes in the level of inventories. It is generally obtained from industry reports of acquisitions and distinguishes only the broad categories of capital formation. The 1993 SNA recognizes a third category of capital formation: net acquisitions of valuables. Included in gross capital formation under the 1993 SNA guidelines are

capital outlays on defense establishments that may be used by the general public, such as schools, airfields, and hospitals, and intangibles such as computer software and mineral exploration outlays. Data on capital formation may be estimated from direct surveys of enterprises and administrative records or based on the commodity flow method using data from production, trade, and construction activities. The quality of data on government fixed capital formation depends on the quality of government accounting systems (which tend to be weak in developing countries). Measures of fixed capital formation by households and corporations—particularly capital outlays by small, unincorporated enterprises—are usually unreliable.

Estimates of changes in inventories are rarely complete but usually include the most important activities or commodities. In some countries these estimates are derived as a composite residual along with household final consumption expenditure. According to national accounts conventions, adjustments should be made for appreciation of the value of inventory holdings due to price changes, but this is not always done. In highly inflationary economies this element can be substantial.

Data on exports and imports are compiled from customs reports and balance of payments data. Although the data from the payments side provide reasonably reliable records of cross-border transactions, they may not adhere strictly to the appropriate definitions of valuation and timing used in the balance of payments or correspond to the change-of-ownership criterion. This issue has assumed greater significance with the increasing globalization of international business. Neither customs nor balance of payments data usually capture the illegal transactions that occur in many countries. Goods carried by travelers across borders in legal but unreported shuttle trade may further distort trade statistics.

Gross savings represent the difference between disposable income and consumption and replace gross domestic savings, a concept used by the World Bank and included in *World Development Indicators* editions before 2006. The change was made to conform to SNA concepts and definitions. For further discussion of the problems in compiling national accounts, see Srinivasan (1994), Heston (1994), and Ruggles (1994). For an analysis of the reliability of foreign trade and national income statistics, see Morgenstern (1963).

Definitions

· Household final consumption expenditure is the market value of all goods and services, including durable products (such as cars and computers), purchased by households. It excludes purchases of dwellings but includes imputed rent for owneroccupied dwellings. It also includes government fees for permits and licenses. Expenditures of nonprofit institutions serving households are included, even when reported separately. Household consumption expenditure may include any statistical discrepancy in the use of resources relative to the supply of resources. • General government final consumption expenditure is all government current expenditures for purchases of goods and services (including compensation of employees). It also includes most expenditures on national defense and security but excludes military expenditures with potentially wider public use that are part of government capital formation. • Gross capital formation is outlays on additions to fixed assets of the economy, net changes in inventories, and net acquisitions of valuables. Fixed assets include land improvements (fences, ditches, drains); plant, machinery, and equipment purchases; and construction (roads, railways, schools, buildings, and so on). Inventories are goods held to meet temporary or unexpected fluctuations in production or sales, and "work in progress." • Exports and imports of goods and services are the value of all goods and other market services provided to or received from the rest of the world. They include the value of merchandise, freight, insurance, transport, travel, royalties, license fees, and other services (communication, construction, financial, information, business, personal, government services, and so on). They exclude compensation of employees and investment income (factor services in the 1968 SNA) and transfer payments. • Gross savings are gross national income less total consumption, plus net transfers.

Data sources

Data on national accounts indicators for most developing countries are collected from national statistical organizations and central banks by visiting and resident World Bank missions. Data for high-income economies are from Organisation for Economic Co-operation and Development (OECD) data files.

a. Includes the French overseas departments of French Guiana, Guadeloupe, Martinique, and Réunion. b. Excludes Transnistria. c. Includes Former Spanish Sahara. d. Covers mainland Tanzania only.

Growth of consumption and investment

About the data

Measures of growth in consumption and capital formation are subject to two kinds of inaccuracy. The first stems from the difficulty of measuring expenditures at current price levels, as described in About the data for table 4.8. The second arises in deflating current price data to measure volume growth. where results depend on the relevance and reliability of the price indexes and weights used. Measuring price changes is more difficult for investment goods than for consumption goods because of the one-time nature of many investments and because the rate of technological progress in capital goods makes capturing change in quality difficult. (An example is computers—prices have fallen as quality has improved.) Several countries estimate capital formation from the supply side, identifying capital goods entering an economy directly from detailed production and international trade statistics. This means that the price indexes used in deflating production and international trade, reflecting delivered or offered prices, will determine the deflator for capital formation expenditures on the demand side.

Growth rates of household final consumption expenditure, household final consumption expenditure per capita, general government final consumption expenditure, gross capital formation, and exports and imports of goods and services are estimated using constant price data. (Consumption, capital formation, and exports and imports of goods and services as shares of GDP are shown in table 4.8.)

To obtain government consumption in constant prices, countries may deflate current values by applying a wage (price) index or extrapolate from the change in government employment. Neither technique captures improvements in productivity or changes in the quality of government services. Deflators for household consumption are usually calculated on the basis of the consumer price index. Many countries estimate household consumption as a residual that includes statistical discrepancies associated with the estimation of other expenditure items, including changes in inventories; thus these estimates lack detailed breakdowns of household consumption expenditures.

Definitions

- Household final consumption expenditure is the market value of all goods and services, including durable products (such as cars and computers), purchased by households. It excludes purchases of dwellings but includes imputed rent for owner-occupied dwellings. It also includes government fees for permits and licenses. Expenditures of nonprofit institutions serving households are included, even when reported separately. Household consumption expenditure may include any statistical discrepancy in the use of resources relative to the supply of resources.
- · Household final consumption expenditure per capita is household final consumption expenditure divided by midyear population. • General government final consumption expenditure is all government current expenditures for goods and services (including compensation of employees). It also includes most expenditures on national defense and security but excludes military expenditures with potentially wider public use that are part of government capital formation. • Gross capital formation is outlays on additions to fixed assets of the economy, net changes in inventories, and net acquisitions of valuables. Fixed assets include land improvements (fences, ditches, drains); plant, machinery, and equipment purchases; and construction (roads, railways, schools, buildings, and so on). Inventories are goods held to meet temporary or unexpected fluctuations in production or sales, and "work in progress." • Exports and imports of goods and services are the value of all goods and other market services provided to or received from the rest of the world. They include the value of merchandise, freight, insurance, transport, travel, royalties, license fees, and other services (communication, construction, financial, information, business, personal, government services, and so on). They exclude compensation of employees and investment income (factor services in the 1968 System of National Accounts) and transfer payments.

4.9a GDP per capita is still lagging in some regions GDP per capita (2000 \$) 5.000 Latin America & Caribbean 4.000 Furone & Central Asia 3,000 Middle East & North Africa 2,000 East Asia & Pacific 1,000 South Asia Sub-Saharan Africa 0 2000

Although GDP per capita more than tripled in East Asia and Pacific between 1990 and 2008, it is still less than GDP per capita in Latin America and Caribbean, Europe and Central Asia, and Middle East and North Africa.

Data sources

Data on national accounts indicators for most developing countries are collected from national statistical organizations and central banks by visiting and resident World Bank missions. Data for high-income economies are from Organisation for Economic Co-operation and Development (OECD) data files.

a. Excludes grants. b. Data were reported on a cash basis and have been adjusted to the accrual framework.

Central government finances

About the data

Tables 4.10-4.12 present an overview of the size and role of central governments relative to national economies. The tables are based on the concepts and recommendations of the second edition of the International Monetary Fund's (IMF) Government Finance Statistics Manual 2001. Before 2005 World Development Indicators reported data derived on the basis of the 1986 manual's cash-based method. The 2001 manual, harmonized with the 1993 United Nations System of National Accounts, recommends an accrual accounting method, focusing on all economic events affecting assets, liabilities, revenues, and expenses, not only those represented by cash transactions. It takes all stocks into account, so that stock data at the end of an accounting period equal stock data at the beginning of the period plus flows over the period. The 1986 manual considered only the debt stock data. Further, the new manual no longer distinguishes between current and capital revenue or expenditures, and it introduces the concepts of nonfinancial and financial assets. Most countries still follow the 1986 manual, however. The IMF has reclassified historical Government Finance Statistics Yearbook data to conform to the 2001 manual's format. Because of reporting differences, the reclassified data understate both revenue and expense.

The 2001 manual describes government's economic functions as the provision of goods and services on a nonmarket basis for collective or individual consumption, and the redistribution of income and wealth through transfer payments. Government activities are financed mainly by taxation and other income transfers, though other financing such as

borrowing for temporary periods can also be used. Government excludes public corporations and quasi corporations (such as the central bank).

Units of government at many levels meet this definition, from local administrative units to the national government, but inadequate statistical coverage precludes presenting subnational data. Although data for general government under the 2001 manual are available for a few countries, only data for the central government are shown to minimize disparities. Still, different accounting concepts of central government make cross-country comparisons potentially misleading.

Central government can refer to consolidated or budgetary accounting. For most countries central government finance data have been consolidated into one account, but for others only budgetary central government accounts are available. Countries reporting budgetary data are noted in *Primary data documentation*. Because budgetary accounts may not include all central government units (such as social security funds), they usually provide an incomplete picture.

Data on government revenue and expense are collected by the IMF through questionnaires to member countries and by the Organisation for Economic Cooperation and Development. Despite IMF efforts to standardize data collection, statistics are often incomplete, untimely, and not comparable across countries.

Government finance statistics are reported in local currency. The indicators here are shown as percentages of GDP. Many countries report government finance data by fiscal year; see *Primary data documentation* for information on fiscal year end by country.

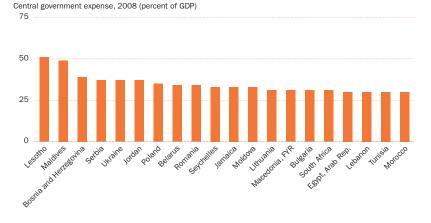

Definitions

· Revenue is cash receipts from taxes, social contributions, and other revenues such as fines, fees, rent, and income from property or sales. Grants, usually considered revenue, are excluded. • Expense is cash payments for government operating activities in providing goods and services. It includes compensation of employees, interest and subsidies, grants, social benefits, and other expenses such as rent and dividends. • Cash surplus or deficit is revenue (including grants) minus expense, minus net acquisition of nonfinancial assets. In editions before 2005 nonfinancial assets were included under revenue and expenditure in gross terms. This cash surplus or deficit is close to the earlier overall budget balance (still missing is lending minus repayments, which are included as a financing item under net acquisition of financial assets). • Net incurrence of liabilities is domestic financing (obtained from residents) and foreign financing (obtained from nonresidents), or the means by which a government provides financial resources to cover a budget deficit or allocates financial resources arising from a budget surplus. The net incurrence of liabilities should be offset by the net acquisition of financial assets (a third financing item). The difference between the cash surplus or deficit and the three financing items is the net change in the stock of cash. • Total debt is the entire stock of direct government fixed-term contractual obligations to others outstanding on a particular date. It includes domestic and foreign liabilities such as currency and money deposits, securities other than shares, and loans. It is the gross amount of government liabilities reduced by the amount of equity and financial derivatives held by the government. Because debt is a stock rather than a flow, it is measured as of a given date, usually the last day of the fiscal year. • Interest payments are interest payments on government debt-including long-term bonds, long-term

Interest payments are interest payments on government debt—including long-term bonds, long-term loans, and other debt instruments—to domestic and foreign residents.

Data sources

Data on central government finances are from the IMF's Government Finance Statistics Yearbook 2008 and data files. Each country's accounts are reported using the system of common definitions and classifications in the IMF's Government Finance Statistics Manual 2001. See these sources for complete and authoritative explanations of concepts, definitions, and data sources.

Central government expenses

About the data

The term expense has replaced expenditure in the table since the 2005 edition of World Development Indicators in accordance with use in the International Monetary Fund's (IMF) Government Finance Statistics Manual 2001. Government expenses include all nonrepayable payments, whether current or capital, requited or unrequited. The concept of total central government expense as presented in the IMF's Government Finance Statistics Yearbook is comparable to the concept used in the 1993 United Nations System of National Accounts.

Expenses can be measured either by function (health, defense, education) or by economic type (interest payments, wages and salaries, purchases of goods and services). Functional data are often incomplete, and coverage varies by country because functional responsibilities stretch across levels of government for which no data are available. Defense expenses, usually the central government's responsibility, are shown in table 5.7. For more information on education expenses, see table 2.11; for more on health expenses, see table 2.16.

The classification of expenses by economic type in the table shows whether the government produces goods and services and distributes them, purchases the goods and services from a third party and distributes them, or transfers cash to households to make the purchases directly. When the government produces and provides goods and services, the cost is reflected in compensation of employees, use of goods and services, and consumption of fixed capital. Purchases from a third party and cash transfers to households are shown as subsidies and other

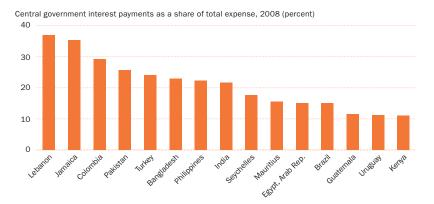

transfers, and other expenses. The economic classification can be problematic. For example, the distinction between current and capital expense may be arbitrary, and subsidies to public corporations or banks may be disguised as capital financing. Subsidies may also be hidden in special contractual pricing for goods and services. For further discussion of government finance statistics, see *About the data* for tables 4.10 and 4.12.

Definitions

- Goods and services are all government payments in exchange for goods and services used for the production of market and nonmarket goods and services. Own-account capital formation is excluded.
- Compensation of employees is all payments in cash, as well as in kind (such as food and housing), to employees in return for services rendered, and government contributions to social insurance schemes such as social security and pensions that provide benefits to employees. • Interest payments are payments made to nonresidents, to residents, and to other general government units for the use of borrowed money. (Repayment of principal is shown as a financing item, and commission charges are shown as purchases of services.) . Subsidies and other transfers include all unrequited, nonrepayable transfers on current account to private and public enterprises; grants to foreign governments, international organizations, and other government units; and social security, social assistance benefits, and employer social benefits in cash and in kind. • Other expense is spending on dividends, rent, and other miscellaneous expenses, including provision for consumption of fixed capital.

Interest payments are a large part of government expenses for some developing economies

4.11a

Interest payments accounted for more than 11 percent of total expenses in 2008 for 15 countries.

Source: International Monetary Fund, Government Finance Statistics data files.

Data sources

Data on central government expenses are from the IMF's Government Finance Statistics Yearbook 2008 and data files. Each country's accounts are reported using the system of common definitions and classifications in the IMF's Government Finance Statistics Manual 2001. See these sources for complete and authoritative explanations of concepts, definitions, and data sources.

 $\textbf{Note:} \ \textbf{Components may not sum to 100 percent because of missing data or adjustment to tax revenue.}$

a. Data were reported on a cash basis and have been adjusted to the accrual framework.

The International Monetary Fund (IMF) classifies government revenues as taxes, grants, and property income. Taxes are classified by the base on which the tax is levied, grants by the source, and property income by type (for example, interest, dividends, or rent). The most important source of revenue is taxes. Grants are unrequited, nonrepayable, noncompulsory receipts from other government units and foreign governments or from international organizations. Transactions are generally recorded on an account basis.

The IMF's Government Finance Statistics Manual 2001 describes taxes as compulsory, unrequited payments made to governments by individuals, businesses, or institutions. Taxes are classified in six major groups by the base on which the tax is levied: income, profits, and capital gains; payroll and workforce; property; goods and services; international trade and transactions; and other. However, the distinctions are not always clear. Taxes levied on the income and profits of individuals and corporations are classified as direct taxes, and taxes and duties levied on goods and services are classified as indirect taxes. This distinction may be a useful simplification, but it has no particular analytical significance except with respect to the capacity to fix tax rates.

Direct taxes tend to be progressive, whereas indirect taxes are proportional.

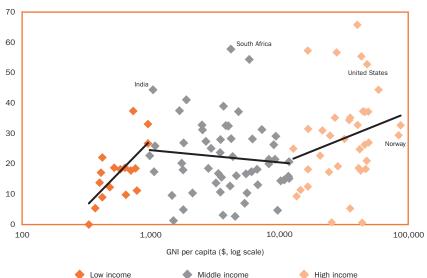

Social security taxes do not reflect compulsory payments made by employers to provident funds or other agencies with a like purpose. Similarly, expenditures from such funds are not reflected in government expenses (see table 4.11). For further discussion of taxes and tax policies, see *About the data* for table 5.6. For further discussion of government revenues and expenditures, see *About the data* for tables 4.10 and 4.11.

Definitions

· Taxes on income, profits, and capital gains are levied on the actual or presumptive net income of individuals, on the profits of corporations and enterprises, and on capital gains, whether realized or not, on land, securities, and other assets. Intragovernmental payments are eliminated in consolidation. • Taxes on goods and services include general sales and turnover or value added taxes. selective excises on goods, selective taxes on services, taxes on the use of goods or property, taxes on extraction and production of minerals, and profits of fiscal monopolies. • Taxes on international trade include import duties, export duties, profits of export or import monopolies, exchange profits, and exchange taxes. • Other taxes include employer payroll or labor taxes, taxes on property, and taxes not allocable to other categories, such as penalties for late payment or nonpayment of taxes. • Social contributions include social security contributions by employees, employers, and self-employed individuals, and other contributions whose source cannot be determined. They also include actual or imputed contributions to social insurance schemes operated by governments. • Grants and other revenue include grants from other foreign governments, international organizations, and other government units; interest; dividends; rent; requited, nonrepayable receipts for public purposes (such as fines, administrative fees, and entrepreneurial income from government ownership of property); and voluntary, unrequited, nonrepayable receipts other than grants.

Rich economies rely more on direct taxes

Taxes on income and capital gains as a share of central government revenue, 2008 (percent)

High-income economies tend to tax income and property, whereas low-income economies tend to rely on indirect taxes on international trade and goods and services. But there are exceptions in all groups.

Note: Data are for the most recent year for 2005–08. Source: International Monetary Fund, Government Finance Statistics data files, and World Development Indicators data files.

Data sources

4.12a

Data on central government revenues are from the IMF's Government Finance Statistics Yearbook 2008 and data files. Each country's accounts are reported using the system of common definitions and classifications in the IMF's Government Finance Statistics Manual 2001. The IMF receives additional information from the Organisation for Economic Co-operation and Development on the tax revenues of some of its members. See the IMF sources for complete and authoritative explanations of concepts, definitions, and data sources.

a. As members of the European Monetary Union, these countries share a single currency, the euro.

About the data

Money and the financial accounts that record the supply of money lie at the heart of a country's financial system. There are several commonly used definitions of the money supply. The narrowest, M1, encompasses currency held by the public and demand deposits with banks. M2 includes M1 plus time and savings deposits with banks that require prior notice for withdrawal. M3 includes M2 as well as various money market instruments, such as certificates of deposit issued by banks, bank deposits denominated in foreign currency, and deposits with financial institutions other than banks. However defined, money is a liability of the banking system, distinguished from other bank liabilities by the special role it plays as a medium of exchange, a unit of account, and a store of value.

The banking system's assets include its net foreign assets and net domestic credit. Net domestic credit includes credit extended to the private sector and general government and credit extended to the nonfinancial public sector in the form of investments in short- and long-term government securities and loans to state enterprises; liabilities to the public and private sectors in the form of deposits with the banking system are netted out. Net domestic credit also includes credit to banking and nonbank financial institutions.

Domestic credit is the main vehicle through which changes in the money supply are regulated, with central bank lending to the government often playing the most important role. The central bank can regulate lending to the private sector in several ways—for example, by adjusting the cost of the refinancing facilities it provides to banks, by changing market interest rates through open market operations, or by controlling the availability of credit through changes in the reserve requirements imposed on banks and ceilings on the credit provided by banks to the private sector.

Monetary accounts are derived from the balance sheets of financial institutions—the central bank, commercial banks, and nonbank financial intermediaries. Although these balance sheets are usually reliable, they are subject to errors of classification, valuation, and timing and to differences in accounting practices. For example, whether interest income is recorded on an accrual or a cash basis can make a substantial difference, as can the treatment of nonperforming assets. Valuation errors typically arise for foreign exchange transactions, particularly in countries with flexible exchange rates or in countries that have undergone currency devaluation during the

reporting period. The valuation of financial derivatives and the net liabilities of the banking system can also be difficult. The quality of commercial bank reporting also may be adversely affected by delays in reports from bank branches, especially in countries where branch accounts are not computerized. Thus the data in the balance sheets of commercial banks may be based on preliminary estimates subject to constant revision. This problem is likely to be even more serious for nonbank financial intermediaries.

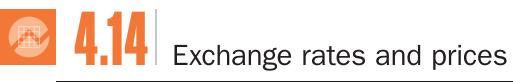

Many interest rates coexist in an economy, reflecting competitive conditions, the terms governing loans and deposits, and differences in the position and status of creditors and debtors. In some economies interest rates are set by regulation or administrative fiat. In economies with imperfect markets, or where reported nominal rates are not indicative of effective rates, it may be difficult to obtain data on interest rates that reflect actual market transactions. Deposit and lending rates are collected by the International Monetary Fund (IMF) as representative interest rates offered by banks to resident customers. The terms and conditions attached to these rates differ by country, however, limiting their comparability. Real interest rates are calculated by adjusting nominal rates by an estimate of the inflation rate in the economy. A negative real interest rate indicates a loss in the purchasing power of the principal. The real interest rates in the table are calculated as (i - P) / (1 + P), where i is the nominal lending interest rate and P is the inflation rate (as measured by the GDP deflator).

Definitions

- Money and quasi money are the sum of currency outside banks, demand deposits other than those of the central government, and the time, savings, and foreign currency deposits of resident sectors other than the central government. This definition of the money supply, often called M2, corresponds to lines 34 and 35 in the IMF's International Financial Statistics (IFS). The change in money supply is measured as the difference in end-of-year totals relative to M2 in the preceding year. Claims on private sector (IFS line 32 d) include gross credit from the financial system to individuals, enterprises, nonfinancial public entities not included under net domestic credit, and financial institutions not included elsewhere.
- · Claims on governments and other public entities (IFS line 32 an + 32 b + 32 bx + 32 c) usually comprise direct credit for specific purposes, such as financing the government budget deficit; loans to state enterprises; advances against future credit authorizations; and purchases of treasury bills and bonds, net of deposits by the public sector. Public sector deposits with the banking system also include sinking funds for the service of debt and temporary deposits of government revenues. • Deposit interest rate is the rate paid by commercial or similar banks for demand, time, or savings deposits. . Lending interest rate is the rate charged by banks on loans to prime customers. • Real interest rate is the lending interest rate adjusted for inflation as measured by the GDP deflator.

Data sources

Data on monetary and financial statistics are published by the IMF in its monthly International Financial Statistics and annual International Financial Statistics Yearbook. The IMF collects data on the financial systems of its member countries. The World Bank receives data from the IMF in electronic files that may contain more recent revisions than the published sources. The discussion of monetary indicators draws from an IMF publication by Marcello Caiola, A Manual for Country Economists (1995). Also see the IMF's Monetary and Financial Statistics Manual (2000) for guidelines for the presentation of monetary and financial statistics. Data on real interest rates are derived from World Bank data on the GDP deflator.

Note: The differences in the growth rates of the GDP deflator and consumer and wholesale price indexes are due mainly to differences in data availability for each of the indexes during the

a. Average for December or latest monthly data available. b. Private analysts estimate that consumer price index inflation was considerably higher for 2007–09 and believe that GDP volume growth has been significantly lower than official reports indicate since the last quarter of 2008. c. As members of the euro area, these countries share a single currency, the euro.

Exchange rates and prices

About the data

In a market-based economy, household, producer, and government choices about resource allocation are influenced by relative prices, including the real exchange rate, real wages, real interest rates, and other prices in the economy. Relative prices also largely reflect these agents' choices. Thus relative prices convey vital information about the interaction of economic agents in an economy and with the rest of the world.

The exchange rate is the price of one currency in terms of another. Official exchange rates and exchange rate arrangements are established by governments. Other exchange rates recognized by governments include market rates, which are determined largely by legal market forces, and for countries with multiple exchange arrangements, principal rates, secondary rates, and tertiary rates. (Also see Statistical methods for alternative conversion factors in the World Bank Atlas method of calculating gross national income [GNI] per capita in U.S. dollars.)

Official or market exchange rates are often used to convert economic statistics in local currencies to a common currency in order to make comparisons across countries. Since market rates reflect at best the relative prices of tradable goods, the volume of goods and services that a U.S. dollar buys in the United States may not correspond to what a U.S. dollar converted to another country's currency at the official exchange rate would buy in that country, particularly when nontradable goods and services account for a significant share of a country's output. An alternative exchange rate—the purchasing power parity (PPP) conversion factor—is preferred because it reflects differences in price levels for both tradable and nontradable goods and services and therefore provides a more meaningful comparison of real output. See table 1.1 for further discussion.

The ratio of the PPP conversion factor to the official exchange rate—the national price level or comparative price level-measures differences in the price level at the gross domestic product (GDP) level. The price level index tends to be lower in poorer countries and to rise with income. The market exchange rate (or alternative conversion factor) is the official exchange rate adjusted for some countries by World Bank staff to reflect actual price changes. National price levels vary systematically, rising with GNI per capita. The real effective exchange rate is a nominal effective exchange rate index adjusted for relative movements in national price or cost indicators of the home country, selected countries, and the euro area. A nominal effective exchange rate index is the ratio (expressed on the base 2000 = 100) of an index of a currency's period-average exchange rate to a weighted geometric average of exchange rates

for currencies of selected countries and the euro area. For most high-income countries weights are derived from industrial country trade in manufactured goods. Data are compiled from the nominal effective exchange rate index and a cost indicator of relative normalized unit labor costs in manufacturing. For selected other countries the nominal effective exchange rate index is based on manufactured goods and primary products trade with partner or competitor countries. For these countries the real effective exchange rate index is the nominal index adjusted for relative changes in consumer prices; an increase represents an appreciation of the local currency. Because of conceptual and data limitations, changes in real effective exchange rates should be interpreted with caution.

Inflation is measured by the rate of increase in a price index, but actual price change can be negative. The index used depends on the prices being examined. The GDP deflator reflects price changes for total GDP. The most general measure of the overall price level, it accounts for changes in government consumption, capital formation (including inventory appreciation), international trade, and the main component, household final consumption expenditure. The GDP deflator is usually derived implicitly as the ratio of current to constant price GDP—or a Paasche index. It is defective as a general measure of inflation for policy use because of long lags in deriving estimates and because it is often an annual measure.

Consumer price indexes are produced more frequently and so are more current. They are also constructed explicitly, based on surveys of the cost of a defined basket of consumer goods and services. Nevertheless, consumer price indexes should be interpreted with caution. The definition of a household, the basket of goods, and the geographic (urban or rural) and income group coverage of consumer price surveys can vary widely by country. In addition, weights are derived from household expenditure surveys, which, for budgetary reasons, tend to be conducted infrequently in developing countries. impairing comparability over time. Although useful for measuring consumer price inflation within a country, consumer price indexes are of less value in comparing countries.

Wholesale price indexes are based on the prices at the first commercial transaction of commodities that are important in a country's output or consumption. Prices are farm-gate for agricultural commodities and ex-factory for industrial goods. Preference is given to indexes with the broadest coverage of the economy.

The least squares method is used to calculate growth rates of the GDP implicit deflator, consumer price index, and wholesale price index.

Definitions

. Official exchange rate is the exchange rate determined by national authorities or the rate determined in the legally sanctioned exchange market. It is calculated as an annual average based on monthly averages (local currency units relative to the U.S. dollar). • Purchasing power parity (PPP) conversion factor is the number of units of a country's currency required to buy the same amount of goods and services in the domestic market that a U.S. dollar would buy in the United States. • Ratio of PPP conversion factor to market exchange rate is the result obtained by dividing the PPP conversion factor by the market exchange rate. • Real effective exchange rate is the nominal effective exchange rate (a measure of the value of a currency against a weighted average of several foreign currencies) divided by a price deflator or index of costs. • GDP implicit deflator measures the average annual rate of price change in the economy as a whole for the periods shown. • Consumer price index reflects changes in the cost to the average consumer of acquiring a basket of goods and services that may be fixed or may change at specified intervals, such as yearly. The Laspeyres formula is generally used. • Wholesale price index refers to a mix of agricultural and industrial goods at various stages of production and distribution, including import duties. The Laspeyres formula is generally used.

Data sources

Data on official and real effective exchange rates and consumer and wholesale price indexes are from the International Monetary Fund's *International Financial Statistics*. PPP conversion factors and GDP deflators are from the World Bank's data files.

a. International reserves including gold valued at London gold price. b. Includes Luxembourg.

Balance of payments current account

About the data

The balance of payments records an economy's transactions with the rest of the world. Balance of payments accounts are divided into two groups: the current account, which records transactions in goods, services, income, and current transfers, and the capital and financial account, which records capital transfers, acquisition or disposal of nonproduced, nonfinancial assets, and transactions in financial assets and liabilities. The table presents data from the current account plus gross international reserves.

The balance of payments is a double-entry accounting system that shows all flows of goods and services into and out of an economy; all transfers that are the counterpart of real resources or financial claims provided to or by the rest of the world without a quid pro quo, such as donations and grants; and all changes in residents' claims on and liabilities to nonresidents that arise from economic transactions. All transactions are recorded twice—once as a credit and once as a debit. In principle the net balance should be zero, but in practice the accounts often do not balance, requiring inclusion of a balancing item, net errors and omissions.

Discrepancies may arise in the balance of payments because there is no single source for balance of payments data and therefore no way to ensure that the data are fully consistent. Sources include customs data, monetary accounts of the banking

system, external debt records, information provided by enterprises, surveys to estimate service transactions, and foreign exchange records. Differences in collection methods—such as in timing, definitions of residence and ownership, and the exchange rate used to value transactions—contribute to net errors and omissions. In addition, smuggling and other illegal or quasi-legal transactions may be unrecorded or misrecorded. For further discussion of issues relating to the recording of data on trade in goods and services, see *About the data* for tables 4.4–4.7.

The concepts and definitions underlying the data in the table are based on the fifth edition of the International Monetary Fund's (IMF) Balance of Payments Manual (1993). That edition redefined as capital transfers some transactions previously included in the current account, such as debt forgiveness, migrants' capital transfers, and foreign aid to acquire capital goods. Thus the current account balance now reflects more accurately net current transfer receipts in addition to transactions in goods, services (previously nonfactor services), and income (previously factor income). Many countries maintain their data collection systems according to the fourth edition of the Balance of Payments Manual (1977). Where necessary, the IMF converts such reported data to conform to the fifth edition (see Primary data documentation). Values are in U.S. dollars converted at market exchange rates.

Definitions

 Exports and imports of goods and services are all transactions between residents of an economy and the rest of the world involving a change in ownership of general merchandise, goods sent for processing and repairs, nonmonetary gold, and services. • Net income is receipts and payments of employee compensation for nonresident workers, and investment income (receipts and payments on direct investment, portfolio investment, and other investments and receipts on reserve assets). Income derived from the use of intangible assets is recorded under business services. • Net current transfers are recorded in the balance of payments whenever an economy provides or receives goods, services, income, or financial items without a quid pro quo. All transfers not considered to be capital are current. • Current account balance is the sum of net exports of goods and services, net income, and net current transfers.

• Total reserves are holdings of monetary gold, special drawing rights, reserves of IMF members held by the IMF, and holdings of foreign exchange under the control of monetary authorities. The gold component of these reserves is valued at year-end (December 31) London prices (\$386.75 an ounce in 1995 and \$871.70 an ounce in 2008).

Data sources

Data on the balance of payments are published in the IMF's *Balance of Payments Statistics Yearbook* and *International Financial Statistics*. The World Bank exchanges data with the IMF through electronic files that in most cases are more timely and cover a longer period than the published sources. More information about the design and compilation of the balance of payments can be found in the IMF's *Balance of Payments Manual*, fifth edition (1993), *Balance of Payments Textbook* (1996), and *Balance of Payments Compilation Guide* (1995). The IMF's International Financial Statistics and Balance of Payments databases are available on CD-ROM.

Infrastructure is the missing link of the Millennium Development Goals (MDGs). Infrastructure—the basic framework for delivering energy, transport, water and sanitation, and information and communication technology services to people—directly or indirectly affects people's lives everywhere. That relationship is reflected in the MDGs. Yet only two MDG targets touch on infrastructure services: water and sanitation (target 7.C) and telephones and the Internet (target 8.F); energy and transport are missing entirely. And no goal or target addresses the comprehensive role of infrastructure in achieving the MDGs.

Although income influences performance on the MDGs, it has long been recognized that growth in productivity and incomes and improvements in health and education outcomes require investment in infrastructure. The MDGs are designed to make economic growth more inclusive. Since a large share of people live in rural areas, often far from employment opportunities, policies to reduce poverty require investment in infrastructure and transport. By improving productivity, investments in infrastructure reduce poverty. Access to clean water and sanitation reduces infant mortality. Electricity powers hospitals and refrigerators for vaccines. Roads in rural areas boost school attendance and use of medical clinics. And information and communication technologies can improve teacher training and promote better health practices.

How infrastructure affects the Millennium Development Goals

The results of infrastructure investments are reflected in progress toward the MDGs. Infrastructure that reaches poor people raises their income and welfare by increasing the value of their assets or lowering the costs of inputs and providing better access to markets for their products.

Access to energy improves health and raises house-hold and business productivity. Modern, clean, efficient fuels and electricity power lights that extend livelihood activities beyond daylight hours and power manufacturing equipment that lowers unit costs and increases labor productivity. Modern energy also reduces the cost of home cooking, heating, and lighting, freeing resources for other essential needs, and relieves girls of the need to collect water and wood

for fuel, enabling them to attend school. A household energy and universal access project in Mali is extending electricity to semi-urban and rural areas, improving the quality and efficiency of health and education services and helping sustainably manage forest resources and biomass energy. The project has connected 40,000 homes, 1,080 enterprises, 1,025 rural schools, and 107 health clinics.

Clean cooking fuels and efficient, ventilated stoves improve indoor air quality by reducing particulate matter, a risk factor for acute respiratory infections and other health problems. The World Health Organization estimates that the indoor air pollution created by the more than 3 billion people who use wood, dung, coal, and other traditional fuels inside their homes for cooking and heating is responsible for 1.5 million deaths a year. A rural energy project in Vietnam connected 976 communes with 555,327 households and 2.7 million people to the national power grid, providing some of the poorest rural areas with reliable electricity. However, some energy production, transformation, and transportation has detrimental effects on people and the environment; these can be mitigated by using cleaner, more efficient fuels.

Improved transport can boost income and improve health and education outcomes. Transport infrastructure and services—the roads, bridges, rails,

Improved infrastructure not only improves the living conditions of the poor, but also reduces the costs of business and further encourages business to invest in productive assets. It enlarges markets. It is not surprising that the poor of Africa perceive the isolation associated with the lack of infrastructure to be the cause of their poverty and marginalization. Too far from markets, too far from arable land, too far from hospitals and clinics.

—Trevor Manuel, Finance Minister, South Africa

waterways, ports, and equipment and services they provide—can eliminate growth-constraining bottlenecks and shortages, increase agricultural productivity, improve poor rural farmers' incomes and nutrition, and expand nonfarm employment. Lower transportation costs enable farmers to use fertilizers, mechanized equipment, and new seed varieties, boosting yields and lowering costs. A rural road project in Bangladesh reduced transport costs by 36-38 percent, lowered fertilizer prices, and increased output. Extreme poverty fell 5 percent. In Vietnam rehabilitating rural roads increased the availability of food, boosted wages for agricultural workers, raised completion rates of primary school students, and lifted more than 200,000 people out of poverty (Calderon and Servin 2008).

Timely and affordable delivery of basic services for health, education, water, and sanitation depends on transportation systems. There is a clear association between infant, child, and maternal mortality rates and distance to health care services. Some 40–60 percent of people in developing countries live more than 8 kilometers from a health care facility. In Morocco the number of visits to primary health care facilities doubled in areas with an expanded rural road network compared with a control area. In Pakistan women in villages without an all-weather road have less access to health services (figure 5a).

Improved and affordable transportation systems and safer roads raise school attendance by reducing travel time from home to school. Better accessibility also makes it easier to hire teachers who commute between rural and urban areas. In the Philippines school enrollment rose 10 percent and dropout rates fell 55 percent after rural roads were built. A similar project in Morocco raised girls' enrollments from 28 percent to 68 percent in less than 10 years.

Transportation services contribute strongly to growth and poverty reduction, but emissions from the transport sector have a deleterious impact on the health and environmental MDG targets. The transport sector generates about 13 percent of global greenhouse gas emissions. Transport policy measures can reduce emissions through greater use of railways and inland waterways for freight, better urban public transport services, management of urban road traffic demand to reduce congestion, support of nonmotorized transport, and management of vehicle emissions. Improving energy efficiency in

transport has added benefits for development—more energy savings, less local air pollution, greater energy security, more employment in local industry, and greater competitiveness from higher productivity. Many countries are setting targets and policies for clean energy technologies. China has achieved a vehicle fuel economy standard of 35 miles per gallon of gas and plans to be the world leader in electric vehicles.

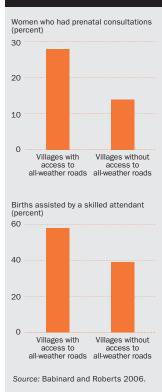

Water and sanitation services promote health, increase productivity, and raise school enrollment. Water and sanitation are crucial for promoting health, enabling people to work productively, and contributing to human dignity and social development. Worldwide, more than 1.1 billion people lack clean water, and about 2.6 billion lack access to basic sanitation. About 90 percent of diarrhea cases are attributable to inadequate sanitation, hygiene, and water supply, causing 1.7 million deaths a year, mostly in children under age 5.

Water and sanitation services at home and in schools increase learning capacity because students are healthier. School attendance also rises for girls if they can spend less time fetching water and if separate sanitation facilities are provided in schools. In a village in Morocco girls' primary school attendance more than doubled a year after a new water supply system began operating, with separate sanitation facilities for girls. An improved water quality project for Uganda's small towns reduced water-borne diseases and benefited women and children by saving time associated with collecting water (World Bank 2007b).

The number of countries that are off track to meet the sanitation MDG target is second only to the number off track in reducing child mortality. Investment in water and sanitation with private participation remains low compared with other infrastructure sectors, accounting for about 2–3 percent of investment in infrastructure (figure 5b).

Information and communication technologies reach into all sectors to improve living conditions. Information and communication technologies (ICTs) are enabling tools used in all sectors, ranging from telecommunication infrastructure (voice, data, and media services) to information applications in banking and finance, land management, education, health, and electronic government services. ICT use has grown

Pakistani women without access to an all-weather road have fewer prenatal consultations and fewer births attended by skilled health staff, 2001–02 5a

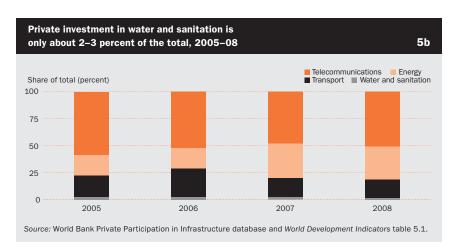

dramatically since 2000—mobile cellular subscriptions in developing countries increased from 220 million to about 2.9 billion by the end of 2008. Worldwide, more than 1.5 billion people have access to the Internet. But even within the same region, access is uneven. In 2008 mobile phone penetration was about 60 percent in Equatorial Guinea, the Gambia, and Mauritania but just 4 percent in Eritrea and Ethiopia.

There is a strong association between ICT adoption (such as mobile phones and Internet access) and GDP growth. Mobile communications have a particularly important impact in rural areas, home to half the world's population and 75 percent of poor people. The mobility, ease of use, and relatively low and declining rollout costs of wireless technologies enable them to reach rural populations with low incomes and literacy rates. Farmers with mobile phones are more likely to have better information on market prices and therefore to get better prices from traders. For farmers in rural areas of the Philippines, having a mobile phone increased income 11-17 percent during 2003-06. India's e-Choupal program, which expanded broadband to millions of small farmers through centers set up by a large agricultural exporter, enabled farmers to access information on local weather, crop prices, and farming techniques, increasing productivity and incomes (World Bank 2009I).

Information and communication technologies also contribute to women's economic opportunities. In the Philippines 65 percent of professional and technical workers in ICTenabled services are women. Information and communication technologies can improve health outcomes and combat diseases. In rural Niger the number of emergency evacuations from outlying health centers to the district hospital increased from 10 to 197 following the introduction of a radio-ambulance system. Good communications and information sharing help to deliver diagnostic information and drugs and to spread information on reproductive health and communicable diseases. Through the Global Media AIDS Initiative more than 50 broadcast networks are promoting AIDS prevention messages. In the fight against malaria satellite monitoring identifies and targets mosquito breeding areas for control.

Information and communication technologies are also used for early disaster warning and for mitigation and relief following natural disasters. Remote sensing is used in managing resources

and monitoring environmental risks. Telecommuting and attending virtual meetings through video conferencing can reduce travel and energy use, helping lower greenhouse gases. Smart grids and building construction using information and communication technologies lower energy consumption and greenhouse gases, leading to a more sustainable environment and way of life.

Bridging the infrastructure gap through public and private financing and better management of infrastructure services

Meeting the world's infrastructure needs involves enormous challenges. More than 1.1 billion people do not have safe water to drink and 2.6 billion lack access to adequate sanitation services. Some 1.6 billion have no electricity in their homes. And 1 billion rural residents live more than 2 kilometers from an all-weather road. World Bank Enterprise Surveys, completed in more than 100 countries, find that the three main deterrents to private investment are the regulatory environment, access to finance, and infrastructure. In many developing countries inadequate infrastructure constrains businesses as much as crime, red tape, corruption, and underdeveloped financial markets. In South Asia and Sub-Saharan Africa more than half of firms report that lack of reliable electricity is a major constraint to doing business (figure 5c).

Job creation and economic growth in the private sector require a supportive investment climate. Developing countries need about \$900 billion (7–9 percent of GDP) to maintain existing infrastructure and to build new infrastructure, but only half that amount is available. The global financial and economic crisis is expected to severely curtail infrastructure services as

governments face shrinking budgets and declining private financial flows. Capital market financing for developing country infrastructure has contracted from \$200 billion in 2007 to \$135 billion in 2008, with a further decline expected for 2009 (World Bank 2009j).

As budgets shrink, priorities are to protect poor and vulnerable groups by strengthening social safety nets and supporting economic growth. But there is also a need to invest in infrastructure, which can create jobs and lay the groundwork for productivity and growth. Infrastructure spending can provide an important

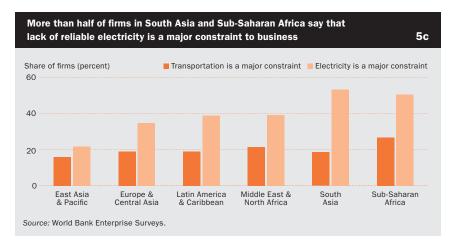

5d

countercyclical stimulus by increasing demand and employment while supporting longer term growth. Over time, inadequate infrastructure slows economic development and poverty reduction. During a crisis countries under financial stress often cut infrastructure more than other government spending. In Latin America and the Caribbean during the fiscal austerity of the 1980s and 1990s, half the fiscal adjustment came from cuts in public infrastructure, reducing long-term growth by 1–3 percent (Schwartz, Andres, and Dragoiu 2009).

The World Bank has focused its response to the crisis on protecting the most vulnerable groups, maintaining long-term infrastructure investment, and supporting private sector–led economic growth, microfinance, and employment creation, especially among small and medium-size enterprises. The World Bank Infrastructure Recovery and Assets platform mobilizes finance to support infrastructure spending critical for growth. The International Finance Corporation's Infrastructure Crisis Facility supports and refinances public-private partnerships at risk; it is investing about \$300 million to mobilize \$1.5–\$10 billion from other sources.

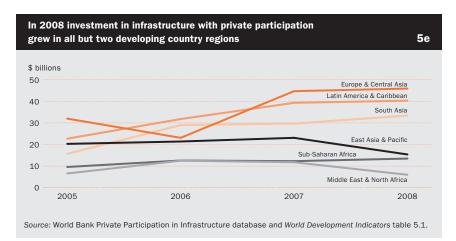

Governments can leverage the benefits of private investment in infrastructure by introducing competition. Regional collaboration on infrastructure projects, by sharing scarce resources such as energy, capital, knowledge, and services, can lower unit costs, improve international competitiveness, and increase connectivity (box 5d). Private companies can better manage infrastructure services by operating efficiently (improving bill collection, reducing corruption and red tape, improving labor productivity, reducing transmission losses) and getting infrastructure prices right (prices should also cover basic operations and maintenance). If countries in Sub-Saharan Africa addressed these inefficiencies, the funding required to close the infrastructure gap might be halved.

Despite the financial crisis, private sector investment in infrastructure remains strong. Commitments to infrastructure projects with private participation fell in 2008, but they were still at the second highest level since 1990. In 48 low- and middle-income economies, 216 projects reached financial or contractual closure. Infrastructure investments, including new commitments for projects implemented in previous years, totaled \$154.4 billion in 2008. Investment grew in all developing country regions

Regional collaboration in infrastructure the Greater Mekong Subregion program

In East Asia and Pacific, where countries are increasingly interconnected through land, sea, and air transportation networks, national economic development plans are often supplemented by regional and subregional programs. With support from the Asian Development Bank since 1992 and the World Bank since 2007, Greater Mekong Subregion countries (Cambodia, China, Lao PDR, Myanmar, Thailand, and Vietnam) have established priority transport corridors, laid the groundwork for power interconnection and trade, and developed an information superhighway network. These projects have improved market access, increased trade and investment, and enabled businesses to take advantage of regional and global production chains.

except East Asia and Pacific and the Middle East and North Africa. But there were large disparities. Five countries accounted for almost half the investment in infrastructure with private participation over 1990–2008—Brazil, India, China, Mexico, and the Russian Federation (figures 5e and 5f).

Telecommunications was the only infrastructure sector with increasing investment in 2008, up 1 percent over 2007. Investment was down 7 percent in energy, 10 percent in transport, and 27 percent in water and sanitation. Over 1990–2008 water and sanitation had the lowest share of infrastructure investment with private participation, attracting only 4.4 percent (World Bank Private Participation in Infrastructure Project Database 2008) (figures 5g and 5h).

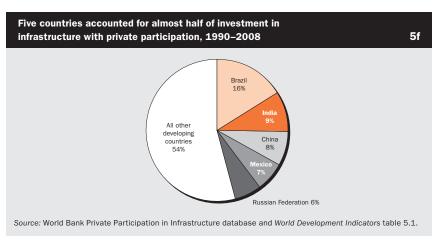

Special focus on Africa's infrastructure

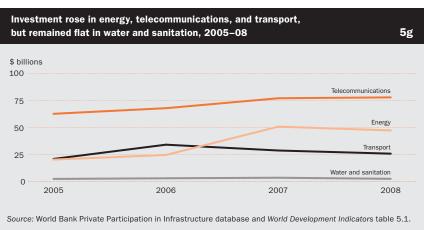

With 15 landlocked countries, transport costs in Sub-Saharan Africa are high, hampering trade and slowing growth. Sub-Saharan Africa also has the lowest population density and the second lowest urbanization rate of all developing country regions, raising the cost of infrastructure investments. Not surprisingly, Africa has a major infrastructure deficit—unreliable power supplies, only about 12 percent of roads paved, and the lowest rates of access to water and sanitation among developing country regions. Sub-Saharan Africa is farthest behind in achieving the MDGs and is expected to fall short of meeting most targets related to poverty, health, education, and water and sanitationwhich all depend on infrastructure services.

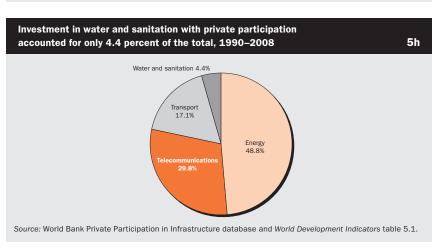

Inadequate infrastructure in Sub-Saharan Africa also contributes to the region's poor economic performance and competitiveness. Business managers report that the main infrastructure deficiencies hampering business activity are electricity (48 percent), transportation (25 percent), and telecommunications (22 percent). Improvements in infrastructure sectors, such as rural roads in Guinea, have raised incomes and increased food supplies for farming families, reducing poverty and hunger.

Expanding information and communications services in Sub-Saharan Africa is connecting the region to the rest of the world and is a key factor in fostering long-term growth. Many governments are beginning to provide affordable ICT services more broadly. Mobile phones, used in all walks of

life (by farmers to receive crop price information and health workers to increase the effectiveness and reach of health programs), increased almost 20-fold on a per capita subscription basis over 2000–08. In 2008 almost a third of Sub-Saharan Africa's people had mobile phone subscriptions. Despite this impressive expansion, a "digital divide" remains: Eritrea has 2 subscriptions per 100 people while South Africa has more than 90.

a. Data refer to total for the period shown. Includes infrastructure projects with private sector participation that reached financial closure in 1990–2008.

Private sector in the economy

About the data

Private sector development and investment—tapping private sector initiative and investment for socially useful purposes—are critical for poverty reduction. In parallel with public sector efforts, private investment, especially in competitive markets, has tremendous potential to contribute to growth. Private markets are the engine of productivity growth, creating productive jobs and higher incomes. And with government playing a complementary role of regulation, funding, and service provision, private initiative and investment can help provide the basic services and conditions that empower poor people—by improving health, education, and infrastructure.

Investment in infrastructure projects with private participation has made important contributions to easing fiscal constraints, improving the efficiency of infrastructure services, and extending delivery to poor people. Developing countries have been in the forefront, pioneering better approaches to infrastructure services and reaping the benefits of greater competition and customer focus.

The data on investment in infrastructure projects with private participation refer to all investment (public and private) in projects in which a private company assumes operating risk during the operating period or development and operating risk during the contract period. Investment refers to commitments not disbursements. Foreign state-owned companies are considered private entities for the purposes of this measure.

Investments are classified into two types: investments in physical assets—the resources a company commits to invest in expanding and modernizing facilities—and payments to the government to acquire state-owned enterprises or rights to provide services in a specific area or to use part of the radio spectrum.

The data are from the World Bank's Private Participation in Infrastructure (PPI) Project database, which tracks infrastructure projects with private participation in developing countries. It provides information on more than 4,300 infrastructure projects in 137 developing economies from 1984 to 2008. The database contains more than 30 fields per project record, including country, financial closure year, infrastructure services provided, type of private participation, investment, technology, capacity, project location, contract duration, private sponsors, bidding process, and development bank support. Data on the projects are compiled from publicly available information. The database aims to be as comprehensive as possible, but some projects—particularly those involving local

and small-scale operators—may be omitted because they are not publicly reported. The database is a joint product of the World Bank's Finance, Economics, and Urban Development Department and the Public-Private Infrastructure Advisory Facility. Geographic and income aggregates are calculated by the World Bank's Development Data Group. For more information, see http://ppi.worldbank.org/.

Credit is an important link in money transmission; it finances production, consumption, and capital formation, which in turn affect economic activity. The data on domestic credit to the private sector are taken from the banking survey of the International Monetary Fund's (IMF) International Financial Statistics or, when unavailable, from its monetary survey. The monetary survey includes monetary authorities (the central bank), deposit money banks, and other banking institutions, such as finance companies, development banks, and savings and loan institutions. Credit to the private sector may sometimes include credit to state-owned or partially state-owned enterprises

Entrepreneurship is essential to the dynamism of the modern market economy, and a greater entry rate of new businesses can foster competition and economic growth. The table includes data on business registrations from the 2008 World Bank Group Entrepreneurship Survey, which includes entrepreneurial activity in more than 100 countries for 2000-08. Survey data are used to analyze firm creation, its relationship to economic growth and poverty reduction, and the impact of regulatory and institutional reforms. The 2008 survey improves on earlier surveys' methodology and country coverage for better cross-country comparability. Data on total and newly registered businesses were collected directly from national registrars of companies. For cross-country comparability, only limited liability corporations that operate in the formal sector are included. For additional information on sources, methodology, calculation of entrepreneurship rates, and data limitations see http://econ.worldbank.org/research/ entrepreneurship.

Definitions

· Investment commitments in infrastructure projects with private participation refers to infrastructure projects in telecommunications, energy (electricity and natural gas transmission and distribution), transport, and water and sanitation that have reached financial closure and directly or indirectly serve the public. Incinerators, movable assets, standalone solid waste projects, and small projects such as windmills are excluded. Included are operation and management contracts, operation and management contracts with major capital expenditure, greenfield projects (new facilities built and operated by a private entity or a public-private joint venture), and divestitures. Investment commitments are the sum of investments in facilities and investments in government assets. Investments in facilities are resources the project company commits to invest during the contract period in new facilities or in expansion and modernization of existing facilities. Investments in government assets are the resources the project company spends on acquiring government assets such as state-owned enterprises, rights to provide services in a specific area, or use of specific radio spectrums. • Domestic credit to private sector is financial resources provided to the private sector—such as through loans, purchases of nonequity securities, and trade credits and other accounts receivable—that establish a claim for repayment. For some countries these claims include credit to public enterprises. . New businesses registered are the number of limited liability firms registered in the calendar year. • Total businesses registered are the year-end stock of total registered limited liability firms.

Data sources

Data on investment commitments in infrastructure projects with private participation are from the World Bank's PPI Project database (http://ppi.worldbank.org). Data on domestic credit are from the IMF's *International Financial Statistics*. Data on business registration and are from the World Bank's Entrepreneurship Survey and database (http://econ.worldbank.org/ research/entrepreneurship).

Note: Enterprise surveys are updated several times a year; see www.enterprisesurveys.org for the most recent updates.

a. The sample was drawn from the manufacturing sector only.

About the data

The World Bank Group's Enterprise Survey gathers firm-level data on the business environment to assess constraints to private sector growth and enterprise performance. Standardized surveys are conducted all over the world, and data are available on more than 100,000 firms in 118 countries. The survey covers 11 dimensions of the business environment, including regulation, corruption, crime, informality, finance, infrastructure, and trade. For some countries, firm-level panel data are available, making it possible to track changes in the business environment over time.

Firms evaluating investment options, governments interested in improving business conditions, and economists seeking to explain economic performance have all grappled with defining and measuring the business environment. The firm-level data from Enterprise Surveys provide a useful tool for benchmarking economies across a large number of indicators measured at the firm level.

Most countries can improve regulation and taxation without compromising broader social interests. Excessive regulation may harm business performance and growth. For example, time spent with tax officials is a burden firms may face in paying taxes. The business environment suffers when governments increase uncertainty and risks or impose unnecessary costs and unsound regulation and taxation. Time to obtain licenses and permits and the associated red tape constrain firm operations.

In some countries doing business requires informal payments to "get things done" in customs, taxes, licenses, regulations, services, and the like. Such corruption harms the business environment by distorting policymaking, undermining government credibility, and diverting public resources. Crime, theft, and disorder also impose costs on businesses and society.

In many developing countries informal businesses operate without formal registration. These firms have less access to financial and public services and can engage in fewer types of contracts and investments, constraining growth.

Equal opportunities for men and women contribute to development. Female participation in firm ownership is a measure of women's integration as decisionmakers.

Financial markets connect firms to lenders and investors, allowing firms to grow their businesses: creditworthy firms can obtain credit from financial intermediaries at competitive prices. But too often market imperfections and government-induced

distortions limit access to credit and thus restrain growth.

The reliability and availability of infrastructure benefit households and support development. Firms with access to modern and efficient infrastructure—telecommunications, electricity, and transport—can be more productive. Firm-level innovation and use of modern technology may help firms compete.

Delays in clearing customs can be costly, deterring firms from engaging in trade or making them uncompetitive globally. Ill-considered labor regulations discourage firms from creating jobs, and while employed workers may benefit, unemployed, low-skilled, and informally employed workers will not. A trained labor force enables firms to thrive, compete, innovate, and adopt new technology.

The data in the table are from Enterprise Surveys implemented by the World Bank's Financial and Private Sector Development Enterprise Analysis Unit. All economies in East Asia and Pacific, Europe and Central Asia, Latin America and the Caribbean, Middle East and North Africa, and Sub-Saharan Africa (for 2009) and Afghanistan, Bangladesh, and India draw a sample of registered nonagricultural businesses, excluding those in the financial and public sectors. Samples for other economies are drawn only from the manufacturing sector and are footnoted in the table. Typical Enterprise Survey sample sizes range from 150 to 1,800, depending on the size of the economy. In each country samples are selected by stratified random sampling, unless otherwise noted. Stratified random sampling allows indicators to be computed by sector, firm size, and region and increases the precision of economywide indicators compared with alternative simple random sampling. Stratification by sector of activity divides the economy into manufacturing and retail and other services sectors. For medium-size and large economies the manufacturing sector is further stratified by industry. Firm size is stratified into small (5-19 employees), medium-size (20-100 employees), and large (more than 100 employees). Geographic stratification divides the national economy into the main centers of economic activity.

Definitions

• Survey year is the year in which the underlying data were collected. • Time dealing with officials is the average percentage of senior management's time that is spent in a typical week dealing with requirements imposed by government regulations. • Average number of times meeting with tax officials is the average number of visits or required meetings with tax officials. • Time required to obtain operating license is the average wait to obtain an operating license from the day applied for to the day granted. • Informal payments to public officials are the percentage of firms that answered positively to the question "Was a gift or informal payment expected or requested during a meeting with tax officials?" · Losses due to theft, robbery, vandalism, and arson are the estimated losses from those causes that occurred on establishments' premises as a percentage of annual sales. • Firms formally registered when operations started are the percentage of firms formally registered when they started operations in the country. Firms not formally registered (the residual) are in the informal sector of the economy. • Firms with female participation in ownership are the percentage of firms with a woman among the owners. • Firms using banks to finance investment are the percentage of firms that invested in fixed assets during the last fiscal year that used banks to finance fixed assets. • Value lost due to electrical outages is losses that resulted from power outages as a percentage of annual sales. • Internationally recognized quality certification ownership is the percentage of firms that have an internationally recognized quality certification, such as International Organization for Standardization 9000, 9002, or 14000. • Average time to clear direct exports through customs is the average number of days to clear direct exports through customs. • Firms offering formal training are the percentage of firms offering formal training programs for their permanent, full-time employees.

About the data

The economic health of a country is measured not only in macroeconomic terms but also by other factors that shape daily economic activity such as laws, regulations, and institutional arrangements. The Doing Business indicators measure business regulation, gauge regulatory outcomes, and measure the extent of legal protection of property, the flexibility of employment regulation, and the tax burden on businesses.

The table presents a subset of Doing Business indicators covering 7 of the 10 sets of indicators: starting a business, registering property, dealing with construction permits, employing workers, enforcing contracts, protecting investors, and closing a business. Table 5.5 includes Doing Business measures of getting credit, and table 5.6 presents data on paying taxes.

The fundamental premise of the Doing Business project is that economic activity requires good rules and regulations that are efficient, accessible to all who need to use them, and simple to implement. Thus some Doing Business indicators give a higher score for more regulation, such as stricter disclosure requirements in related-party transactions, and others give a higher score for simplified regulations, such as a one-stop shop for completing business startup formalities.

In constructing the indicators, it is assumed that entrepreneurs know about all regulations and comply with them; in practice, entrepreneurs may not be aware of all required procedures or may avoid legally required procedures altogether. But where regulation is particularly onerous, levels of informality are higher, which comes at a cost: firms in the informal sector usually grow more slowly, have less access to credit, and employ fewer workers-and those workers remain outside the protections of labor law. The indicators in the table can help policymakers understand the business environment in a country and—along with information from other sources such as the World Bank's Enterprise Surveys-provide insights into potential areas of reform.

Doing Business data are collected with a standardized survey that uses a simple business case to ensure comparability across economies and over time—with assumptions about the legal form of the business, its size, its location, and nature of its operation. Surveys in 183 countries are administered through more than 8,000 local experts, including lawyers, business consultants, accountants, freight forwarders, government officials, and other professionals who routinely administer or advise on legal and regulatory requirements.

The Doing Business project encompasses two types of data: data from readings of laws and regulations and data on time and motion indicators that measure efficiency in achieving a regulatory goal. Within the time and motion indicators cost estimates are recorded from official fee schedules where applicable. The data from surveys are subjected to numerous tests for robustness, which lead to revision or expansion of the information collected.

The Doing Business methodology has limitations that should be considered when interpreting the data. First, the data collected refer to businesses in the economy's largest city and may not represent regulations in other locations of the economy. To address this limitation, subnational indicators are being collected for selected economies. These subnational studies point to significant differences in the speed of reform and the ease of doing business across cities in the same economy. Second, the data often focus on a specific business form—generally a limited liability company of a specified size—and may not represent regulation for other types of businesses such as sole proprietorships. Third, transactions described in a standardized business case refer to a specific set of issues and may not represent the full set of issues a business encounters. Fourth, the time measures involve an element of judgment by the expert respondents. When sources indicate different estimates, the Doing Business time indicators represent the median values of several responses given under the assumptions of the standardized case. Fifth, the methodology assumes that a business has full information on what is required and does not waste time when completing procedures.

Definitions

. Number of procedures for starting a business is the number of procedures required to start a business, including interactions to obtain necessary permits and licenses and to complete all inscriptions, verifications, and notifications to start operations for businesses with specific characteristics of ownership, size, and type of production. • Time required for starting a business is the number of calendar days to complete the procedures for legally operating a business using the fastest procedure, independent of cost. . Cost for starting a business is normalized as a percentage of gross national income (GNI) per capita. It includes all official fees for professional or legal services if they are required by law. • Number of procedures for registering property is the number of procedures required for a business to legally transfer property. • Time required for registering property is the number of calendar days for a business to legally transfer property. • Number of procedures for dealing with licenses to build a warehouse is the number of interactions of a company's employees or managers with external parties, including government staff, public inspectors, notaries, land registry and cadastre staff, and technical experts apart from architects and engineers. . Time required for dealing with construction permits to build a warehouse is the number of calendar days to complete the required procedures for building a warehouse using the fastest procedure, independent of cost. . Rigidity of employment index, a measure of employment regulation, is the average of three subindexes: a difficulty of hiring index, a rigidity of hours index, and a difficulty of firing index. Higher values indicate more rigid regulations. • Number of procedures for enforcing contracts is the number of independent actions, mandated by law or court regulation, that demand interaction between the parties to a contract or between them and the judge or court officer. • Time required for enforcing contracts is the number of calendar days from the time of the filing of a lawsuit in court to the final determination and payment. • Extent of disclosure index measures the degree to which investors are protected through disclosure of ownership and financial information. Higher values indicate more disclosure. • Time to resolve insolvency is the number of years from time of filing for insolvency in court until resolu-

About the data

The development of an economy's financial markets is closely related to its overall development. Well functioning financial systems provide good and easily accessible information. That lowers transaction costs, which in turn improves resource allocation and boosts economic growth. Both banking systems and stock markets enhance growth, the main factor in poverty reduction. At low levels of economic development commercial banks tend to dominate the financial system, while at higher levels domestic stock markets tend to become more active and efficient relative to domestic banks.

Open economies with sound macroeconomic policies, good legal systems, and shareholder protection attract capital and therefore have larger financial markets. Recent research on stock market development shows that modern communications technology and increased financial integration have resulted in more cross-border capital flows, a stronger presence of financial firms around the world, and the migration of stock exchange activities to international exchanges. Many firms in emerging markets now cross-list on international exchanges, which provides them with lower cost capital and more liquidity-traded shares. However, this also means that exchanges in emerging markets may not have enough financial activity to sustain them, putting pressure on them to rethink their operations.

The indicators in the table are from Standard & Poor's Emerging Markets Data Base. They include measures of size (market capitalization, number of listed domestic companies) and liquidity (value of shares traded as a percentage of gross domestic product, value of shares traded as a percentage of market capitalization). The comparability of such indicators across countries may be limited by conceptual and statistical weaknesses, such as inaccurate reporting and differences in accounting standards. The percentage change in stock market prices in U.S. dollars for developing economies is from Standard & Poor's Global Equity Indices (S&P IFCI) and Standard & Poor's Frontier Broad Market Index (BMI). The percentage change for France, Germany, Japan, the United Kingdom, and the United States is from local stock market prices. The indicator is an important measure of overall performance. Regulatory and institutional factors that can affect investor confidence, such as entry and exit restrictions, the existence of a securities and exchange commission, and the quality of laws to protect investors, may influence the functioning of stock markets but are not included in the table.

Stock market size can be measured in various ways, and each may produce a different ranking of

countries. Market capitalization shows the overall size of the stock market in U.S. dollars and as a percentage of GDP. The number of listed domestic companies is another measure of market size. Market size is positively correlated with the ability to mobilize capital and diversify risk.

Market liquidity, the ability to easily buy and sell securities, is measured by dividing the total value of shares traded by GDP. The turnover ratio-the value of shares traded as a percentage of market capitalization—is also a measure of liquidity as well as of transaction costs. (High turnover indicates low transaction costs.) The turnover ratio complements the ratio of value traded to GDP, because the turnover ratio is related to the size of the market and the value traded ratio to the size of the economy. A small, liquid market will have a high turnover ratio but a low value of shares traded ratio. Liquidity is an important attribute of stock markets because, in theory, liquid markets improve the allocation of capital and enhance prospects for long-term economic growth. A more comprehensive measure of liquidity would include trading costs and the time and uncertainty in finding a counterpart in settling trades.

Standard & Poor's Index Services, the source for all the data in the table, provides regular updates on 22 emerging stock markets and 36 frontier markets. Standard & Poor's maintains a series of indexes for investors interested in investing in stock markets in developing countries. The S&P/IFCI index, Standard & Poor's leading emerging markets index, is designed to be sufficiently investable to support index tracking portfolios in emerging market stocks that are legally and practically open to foreign portfolio investment. The S&P/Frontier BMI measures the performance of 36 smaller and less liquid markets. The individual country indexes include all publicly listed equities representing an aggregate of at least 80 percent or more of market capitalization in each market. These indexes are widely used benchmarks for international portfolio management. See www.standardandpoors. com for further information on the indexes.

Because markets included in Standard & Poor's emerging markets category vary widely in level of development, it is best to look at the entire category to identify the most significant market trends. And it is useful to remember that stock market trends may be distorted by currency conversions, especially when a currency has registered a significant devaluation.

About the data is based on Demirgüç-Kunt and Levine (1996), Beck and Levine (2001), and Claessens, Klingebiel, and Schmukler (2002).

Definitions

· Market capitalization (also known as market value) is the share price times the number of shares outstanding. • Market liquidity is the total value of shares traded during the period divided by gross domestic product (GDP). This indicator complements the market capitalization ratio by showing whether market size is matched by trading. • Turnover ratio is the total value of shares traded during the period divided by the average market capitalization for the period. Average market capitalization is calculated as the average of the end-of-period values for the current period and the previous period. • Listed domestic companies are the domestically incorporated companies listed on the country's stock exchanges at the end of the year. This indicator does not include investment companies, mutual funds, or other collective investment vehicles. • S&P/Global Equity Indices measure the U.S. dollar price change in the stock markets.

Data sources

Data on stock markets are from Standard & Poor's Global Stock Markets Factbook 2009, which draws on the Emerging Markets Data Base, supplemented by other data from Standard & Poor's. The firm collects data through an annual survey of the world's stock exchanges, supplemented by information provided by its network of correspondents and by Reuters. Data on GDP are from the World Bank's national accounts data files.

About the data

Financial sector development has positive impacts on economic growth and poverty. The size of the sector determines the resources mobilized for investment. Access to finance can expand opportunities for all with higher levels of access and use of banking services associated with lower financing obstacles for people and businesses. A stable financial system that promotes efficient savings and investment is also crucial for a thriving democracy and market economy. The banking system is the largest sector in the financial system in most countries, so most indicators in the table cover the banking system.

There are several aspects of access to financial services: availability, cost, and quality of services. The development and growth of credit markets depend on access to timely, reliable, and accurate data on borrowers' credit experiences. For secured transactions, such as mortgages or vehicle loans, rapid access to information in property registries is also vital, and for small business loans corporate registry data are needed. Access to credit can be improved by increasing information about potential borrowers' creditworthiness and making it easy to create and enforce collateral agreements. Lenders look at a borrower's credit history and collateral. Where credit registries and effective collateral laws are absent—as in many developing countries banks make fewer loans. Indicators that cover financial access, or getting credit, include the strength of legal rights index (ranges from 0, weak, to 10, strong), depth of credit information index (ranges from 0, low, to 6, high), public registry coverage, and private bureau coverage.

The strength of legal rights index is based on eight aspects related to legal rights in collateral law and two aspects in bankruptcy law. It is based on a standardized case scenario and measures the degree to which collateral and bankruptcy laws protect the rights of borrowers and lenders and thus facilitate lending. The indicator focuses on revolving movable collateral, such as accounts receivable and inventory, rather than tangible movable collateral, such as equipment. The depth of credit information index assesses six features of the public registry or the private credit bureau (or both). For more information on these indexes, see www.doingbusiness.org/MethodologySurveys/.

The size and mobility of international capital flows make it increasingly important to monitor the strength of financial systems. Robust financial systems can increase economic activity and welfare, but instability in the financial system can disrupt financial activity and impose widespread costs on the economy. The ratio of bank capital to assets, a measure of bank solvency and resiliency, shows the extent to which banks can deal with unexpected losses. Capital includes tier 1 capital (paid-up shares and common stock), a common feature in all countries' banking systems, and total regulatory capital, which includes several types of subordinated debt instruments that need not be repaid if the funds are required to maintain minimum capital levels (tier 2 and tier 3 capital). Total assets include all nonfinancial and financial assets. Data are from internally consistent financial statements.

The ratio of bank nonperforming loans to total gross loans, a measure of bank health and efficiency, helps to identify problems with asset quality in the loan portfolio. A high ratio may signal deterioration of the credit portfolio. International guidelines recommend that loans be classified as nonperforming when payments of principal and interest are 90 days or more past due or when future payments are not expected to be received in full. See the International Monetary Fund's (IMF) Global Financial Stability Report for details

Domestic credit by the banking sector as a share of GDP is a measure of banking sector depth and financial sector development in terms of size. In a few countries governments may hold international reserves as deposits in the banking system rather than in the central bank. Since the claims on the central government are a net item (claims on the central government minus central government deposits), this net figure may be negative, resulting in a negative figure of domestic credit provided by the banking sector.

The interest rate spread—the margin between the cost of mobilizing liabilities and the earnings on assets—is a measure of financial sector efficiency in intermediation. A narrow interest rate spread means low transaction costs, which lowers the cost of funds for investment, crucial to economic growth.

The risk premium on lending is the spread between the lending rate to the private sector and the "risk-free" government rate. Spreads are expressed as annual averages. A small spread indicates that the market considers its best corporate customers to be low risk. A negative rate indicates that the market considers its best corporate clients to be lower risk than the government.

Definitions

· Strength of legal rights index measures the degree to which collateral and bankruptcy laws protect the rights of borrowers and lenders and thus facilitate lending. Higher values indicate that the laws are better designed to expand access to credit. • Depth of credit information index measures rules affecting the scope, accessibility, and quality of information available through public or private credit registries. Higher values indicate the availability of more credit information. • Public credit registry coverage is the number of individuals and firms listed in a public credit registry with current information on repayment history, unpaid debts, or credit outstanding as a percentage of the adult population. • Private credit bureau coverage is the number of individuals or firms listed by a private credit bureau with current information on repayment history, unpaid debts, or credit outstanding as a percentage of the adult population. . Bank capital to asset ratio is the ratio of bank capital and reserves to total assets. Capital and reserves include funds contributed by owners, retained earnings, general and special reserves, provisions, and valuation adjustments. • Ratio of bank nonperforming loans to total gross loans is the value of nonperforming loans divided by the total value of the loan portfolio (including nonperforming loans before the deduction of loan loss provisions). The amount recorded as nonperforming should be the gross value of the loan as recorded on the balance sheet, not just the amount overdue. • Domestic credit provided by banking sector is all

redit to various sectors on a gross basis, except to the central government, which is net. The banking sector includes monetary authorities, deposit money banks, and other banking institutions for which data are available. • Interest rate spread is the interest rate charged by banks on loans to prime customers minus the interest rate paid by commercial or similar banks for demand, time, or savings deposits. • Risk premium on lending is the interest rate charged by banks on loans to prime private sector customers minus the "risk-free" treasury bill interest rate at which short-term government securities are issued or traded in the market.

Data sources

Data on getting credit are from the World Bank's Doing Business project (www.doingbusiness.org). Data on bank capital and nonperforming loans are from the IMF's *Global Financial Stability Report*. Data on credit and interest rates are from the IMF's *International Financial Statistics*.

a. Data are from KPMG's Individual Income and Corporate Tax Rate Surveys 2009, unless otherwise noted. b. Data on central government taxes were reported on a cash basis and have been adjusted to the accrual framework of the International Monetary Fund's Government Finance Statistics Manual 2001. c. Data are from PriceWaterhouseCooper's Worldwide Tax

Tax policies

6

About the data

Taxes are the main source of revenue for most governments. The sources of tax revenue and their relative contributions are determined by government policy choices about where and how to impose taxes and by changes in the structure of the economy. Tax policy may reflect concerns about distributional effects, economic efficiency (including corrections for externalities), and the practical problems of administering a tax system. There is no ideal level of taxation. But taxes influence incentives and thus the behavior of economic actors and the economy's competitiveness.

The level of taxation is typically measured by tax revenue as a share of gross domestic product (GDP). Comparing levels of taxation across countries provides a quick overview of the fiscal obligations and incentives facing the private sector. The table shows only central government data, which may significantly understate the total tax burden, particularly in countries where provincial and municipal governments are large or have considerable tax authority.

Low ratios of tax revenue to GDP may reflect weak administration and large-scale tax avoidance or evasion. Low ratios may also reflect a sizable parallel economy with unrecorded and undisclosed incomes. Tax revenue ratios tend to rise with income, with higher income countries relying on taxes to finance a much broader range of social services and social security than lower income countries are able to.

The indicators covering taxes payable by businesses measure all taxes and contributions that are government mandated (at any level-federal, state, or local), apply to standardized businesses, and have an impact in their income statements. The taxes covered go beyond the definition of a tax for government national accounts (compulsory, unrequited payments to general government) and also measure any imposts that affect business accounts. The main differences are in labor contributions and value added taxes. The indicators account for government-mandated contributions paid by the employer to a requited private pension fund or workers insurance fund but exclude value added taxes because they do not affect the accounting profits of the business-that is, they are not reflected in the income statement.

To make the data comparable across countries, several assumptions are made about businesses. The main assumptions are that they are limited liability companies, they operate in the country's most populous city, they are domestically owned, they perform general industrial or commercial activities, and

they have certain levels of start-up capital, employees, and turnover. For details about the assumptions, see the World Bank's *Doing Business 2010*.

A potentially important influence on both domestic and international investors is a tax system's progressivity, as reflected in the highest marginal tax rate levied at the national level on individual and corporate income. Data for individual marginal tax rates generally refer to employment income. In some countries the highest marginal tax rate is also the basic or flat rate, and other surtaxes, deductions, and the like may apply. And in many countries several different corporate tax rates may be levied, depending on the type of business (mining, banking, insurance, agriculture, manufacturing), ownership (domestic or foreign), volume of sales, and whether surtaxes or exemptions are included. The corporate tax rates in the table are general headline rates applied to domestic companies. For more detailed information, see the country's laws, regulations, and tax treaties; KPMG's Corporate and Indirect Tax Rate Survey 2009 and Individual Income Tax and Social Security Rate Survey 2009 (www.kpmg.com); and Pricewaterhouse-Coopers's Worldwide Tax Summaries Online (www. pwc.com).

Definitions

· Tax revenue collected by central government is compulsory transfers to the central government for public purposes. Certain compulsory transfers such as fines, penalties, and most social security contributions are excluded. Refunds and corrections of erroneously collected tax revenue are treated as negative revenue. The analytic framework of the International Monetary Fund's (IMF) Government Finance Statistics Manual 2001 (GFSM 2001) is based on accrual accounting and balance sheets. For countries still reporting government finance data on a cash basis, the IMF adjusts reported data to the GFSM 2001 accrual framework. These countries are footnoted in the table. • Number of tax payments by businesses is the total number of taxes paid by businesses during one year. When electronic filing is available, the tax is counted as paid once a year even if payments are more frequent. . Time to prepare, file, and pay taxes is the time, in hours per year, it takes to prepare, file, and pay (or withhold) three major types of taxes: the corporate income tax, the value-added or sales tax, and labor taxes, including payroll taxes and social security contributions. • Total tax rate is the total amount of taxes payable by a standard business in the second year of operation after accounting for deductions and exemptions as a percentage of profit. Taxes withheld (such as personal income tax) or collected by the company and remitted to tax authorities but not borne by the company (such as value added tax, sales tax on goods, and taxes on services) are excluded. For further details on the method used for assessing the total tax payable, see the World Bank's Doing Business 2010. • Highest marginal tax rate is the highest rate shown on the national schedule of tax rates applied to the annual taxable income of individuals and corporations. Also presented are the income levels for individuals above which the highest marginal tax rates levied at the national level apply.

Data sources

Data on central government tax revenue are from print and electronic editions of the IMF's Government Finance Statistics Yearbook. Data on taxes payable by businesses are from Doing Business 2010 (www.doingbusiness.org). Data on individual and corporate tax rates are from KPMG's Corporate and Indirect Tax Rate Survey 2009 and Individual Income Tax and Social Security Rate Survey 2009 (www.kpmg.com), and PricewaterhouseCoopers's Worldwide Tax Summaries Online (www.pwc.com).

Note: For some countries data are partial or uncertain or based on rough estimates; see SIPRI (2009).

a. Estimates differ from official statistics of the government of China, which has published the following estimates: military expenditure as 1.2 percent of GDP in 2000 and 1.4 percent in 2007 and 7.6 percent of central government expenditure in 2000 and 7.1 percent in 2007 (see National Bureau of Statistics of China, www.stats.gov.cn).

Military expenditures and arms transfers

5.7

About the data

Although national defense is an important function of government and security from external threats that contributes to economic development, high levels of military expenditures for defense or civil conflicts burden the economy and may impede growth. Data on military expenditures as a share of gross domestic product (GDP) are a rough indicator of the portion of national resources used for military activities and of the burden on the national economy. As an "input" measure military expenditures are not directly related to the "output" of military activities, capabilities, or security. Comparisons of military spending between countries should take into account the many factors that influence perceptions of vulnerability and risk, including historical and cultural traditions, the length of borders that need defending, the quality of relations with neighbors, and the role of the armed forces in the body politic.

Data on military spending reported by governments are not compiled using standard definitions. They are often incomplete and unreliable. Even in countries where the parliament vigilantly reviews budgets and spending, military expenditures and arms transfers rarely receive close scrutiny or full, public disclosure (see Ball 1984 and Happe and Wakeman-Linn 1994). Therefore, SIPRI has adopted a definition of military expenditure derived from the North Atlantic Treaty Organization (NATO) definition (see Definitions). The data on military expenditures as a share of GDP and as a share of central government expenditure are estimated by the Stockholm International Peace Research Institute (SIPRI). Central government expenditures are from the International Monetary Fund (IMF). Therefore the data in the table may differ from comparable data published by national

SIPRI's primary source of military expenditure data is official data provided by national governments. These data are derived from national budget documents, defense white papers, and other public documents from official government agencies, including governments' responses to questionnaires sent by SIPRI, the United Nations, or the Organization for Security and Co-operation in Europe. Secondary sources include international statistics, such as those of NATO and the IMF's Government Finance Statistics Yearbook. Other secondary sources include country reports of the Economist Intelligence Unit, country reports by IMF staff, and specialist journals and newspapers.

In the many cases where SIPRI cannot make independent estimates, it uses the national data provided. Because of the differences in definitions and the difficulty in verifying the accuracy and

completeness of data, data on military expenditures are not strictly comparable across countries. More information on SIPRI's military expenditure project can be found at www.sipri.org/contents/milap/.

Data on armed forces refer to military personnel on active duty, including paramilitary forces. Because data exclude personnel not on active duty, they underestimate the share of the labor force working for the defense establishment. Governments rarely report the size of their armed forces, so such data typically come from intelligence sources.

SIPRI's Arms Transfers Project collects data on arms transfers from open sources. Since publicly available information is inadequate for tracking all weapons and other military equipment, SIPRI covers only what it terms major conventional weapons. Data cover the supply of weapons through sales, aid, gifts, and manufacturing licenses; therefore the term arms transfers rather than arms trade is used. SIPRI data also cover weapons supplied to or from rebel forces in an armed conflict as well as arms deliveries for which neither the supplier nor the recipient can be identified with acceptable certainty; these data are available in SIPRI's database.

SIPRI's estimates of arms transfers are designed as a trend-measuring device in which similar weapons have similar values, reflecting both the value and quality of weapons transferred. SIPRI cautions that the estimated values do not reflect financial value (payments for weapons transferred) because reliable data on the value of the transfer are not available, and even when values are known, the transfer usually includes more than the actual conventional weapons, such as spares, support systems, and training, and details of the financial arrangements (such as credit and loan conditions and discounts) are usually not known.

Given these measurement issues, SIPRI's method of estimating the transfer of military resources includes an evaluation of the technical parameters of the weapons. Weapons for which a price is not known are compared with the same weapons for which actual acquisition prices are available (core weapons) or for the closest match. These weapons are assigned a value in an index that reflects their military resource value in relation to the core weapons. These matches are based on such characteristics as size, performance, and type of electronics, and adjustments are made for secondhand weapons. More information on SIPRI's Arms Transfers Project is available at www.sipri.org/contents/armstrad/.

Definitions

. Military expenditures are SIPRI data derived from the NATO definition, which includes all current and capital expenditures on the armed forces, including peacekeeping forces; defense ministries and other government agencies engaged in defense projects; paramilitary forces, if judged to be trained and equipped for military operations; and military space activities. Such expenditures include military and civil personnel, including retirement pensions and social services for military personnel; operation and maintenance; procurement; military research and development; and military aid (in the military expenditures of the donor country). Excluded are civil defense and current expenditures for previous military activities, such as for veterans benefits, demobilization, and weapons conversion and destruction. This definition cannot be applied for all countries, however, since that would require more detailed information than is available about military budgets and off-budget military expenditures (for example, whether military budgets cover civil defense, reserves and auxiliary forces, police and paramilitary forces, and military pensions).

• Armed forces personnel are active duty military personnel, including paramilitary forces if the training, organization, equipment, and control suggest they may be used to support or replace regular military forces. Reserve forces, which are not fully staffed or operational in peace time, are not included. The data also exclude civilians in the defense establishment and so are not consistent with the data on military expenditures on personnel. • Arms transfers cover the supply of military weapons through sales, aid, gifts, and manufacturing licenses. Weapons must be transferred voluntarily by the supplier, have a military purpose, and be destined for the armed forces, paramilitary forces, or intelligence agencies of another country. The trends shown in the table are based on actual deliveries only. Data cover major conventional weapons such as aircraft, armored vehicles, artillery, radar systems, missiles, and ships designed for military use. Excluded are transfers of other military equipment such as small arms and light weapons, trucks, small artillery, ammunition, support equipment, technology transfers, and other services.

Data sources

Data on military expenditures are from SIPRI's Yearbook 2009: Armaments, Disarmament, and International Security. Data on armed forces personnel are from the International Institute for Strategic Studies' The Military Balance 2010. Data on arms transfers are from SIPRI's Arms Transfer Project (www.sipri.org/contents/armstrad/).

Note: The countries with fragile situations in the table are International Development Association-eligible countries with a 3.2 or lower harmonized average of the World Bank's Country Policy and Institutional Assessment (CPIA) rating and the corresponding rating by a regional development bank or that have had a UN or regional peacebuilding mission (for example, by the African Union, European Union, or Organization of American States) or peacekeeping mission (for example, by the African Union, European Union, North Atlantic Treaty Organization, or Organization of American States) during the last three years. Because fragility is an evolving concept, this definition will be updated as understanding changes.

a. UNAMA is United Nations Assistance Mission in Afghanistan, BINUB is Bureau Intégré des Nations Unies au Burundi (United Nations Integrated Office in Burundi), MINURCAT is United Nations Mission in the Central African Republic and Chad, UNOCI is United Nations Operation in Côte d'Ivoire, MONUC is United Nations Organization Mission in DR Congo, MINUSTAH is United Nations Stabilization Mission in Haiti, UNMIK is Interim Administration Mission in Kosovo, UNMIL is United Nations Mission in Liberia, UNMIN is United Nations Mission in Nepal, RAMSI is Regional Assistance Mission to Solomon Islands, UNMIS is United Nations Missions in Sudan, UNMIT is United Nations Integrated Mission in Timor-Leste, and MINURSO is United Nations Mission for the Referendum in Western Sahara. b. Total over the period. c. Data are for the most recent year available. d. Average over the period. e. Data are from Interpol. f. Data are from UNODC's 10th UN Survey of Crime Trends and are for 2005. g. National Statistical Office of Cameroon. h. Includes peacekeepers in Chad. i. Data are from UNODC's 9th UN Survey of Crime Trends. j. Data are for 2001. k. National Statistical Office of Sierra Leone. I. Data are for 2007. m. Does not include 19,949 troops, police, and military observers from the African Union-UN Hybrid Operation in Darfur. n. The designation Western Sahara is used instead of Former Spanish Sahara (the designation used on the maps on the front and back cover flaps) because it is the designation used by the UN operation established there by Security Council resolution 690/1991. Neither designation expresses any World Bank view on the status of the territory so-identified. o. National Statistical Office of Yemen.

About the data

The table focuses on countries with fragile situations and highlights the links among weak institutions, poor development outcomes, fragility, and risk of conflict. These countries often have weak institutions that are ill-equipped to handle economic shocks, natural disasters, and illegal trade or to resist conflict, which increasingly spills across borders. Organized violence, including violent crime, interrupts economic and social development through lost human and social capital, disrupted services, displaced populations and reduced confidence for future investment. As a result, countries with fragile situations achieve lower development outcomes and

make slower progress toward the Millennium Development Goals.

According to the Geneva Declaration on Armed Violence and Development, more than 740,000 people die each year because of the violence associated with armed conflict and large- and small-scale criminality. Recovery and rebuilding can take years, and the challenges are numerous: infrastructure to be rebuilt, persistently high crime, widespread health problems, education systems in disrepair, and landmines to be cleared. Most countries emerging from conflict lack the capacity to rebuild the economy. Thus, capacity building is one of the first tasks for restoring growth

and is linked to building peace and creating the conditions that lead to sustained poverty reduction. The World Bank and other international development agencies can help, but countries with fragile situations have to build their own institutions tailored to their own needs. Peacekeeping operations in post-conflict situations have been effective in reducing the risks of reversion to conflict.

The countries with fragile situations in the table are International Development Association—eligible countries with a 3.2 or lower harmonized average of the World Bank's Country Policy and Institutional Assessment (CPIA) rating and the corresponding rating by a

5.8 Fragile situations

About the data (continued)

regional development bank or that have had a UN or regional peacebuilding mission (for example, by the African Union, European Union, or Organization of American States) or peacekeeping mission (for example, by the African Union, European Union, North Atlantic Treaty Organization, or Organization of American States) during the last three years. Peacebuilding and peacekeeping involve many elements—military, police, and civilian—working together to lay the foundations for sustainable peace. Because fragility is an evolving concept, this definition will be updated as understanding changes.

An armed conflict is a contested incompatibility that concerns a government or territory where the use of armed force between two parties (one of them the government) results in at least 25 battle-related deaths in a calendar year. There were 36 active armed conflicts in 26 locations in 2008. Separate measures are presented for intentional homicides—unlawful deaths purposefully inflicted on a person by another person—which exclude deaths arising from armed conflict. One measure draws from public health data sources, while the other draws from estimates by the United Nations Office on Drugs and Crime, which obtains data from criminal justice sources. Data from these two sources measure different phenomena and are therefore unlikely to provide identical numbers.

Data on military expenditures reported by governments are not compiled using standard definitions and are often incomplete and unreliable. Even in countries where the parliament vigilantly reviews budgets and spending, military expenditures and arms transfers rarely receive close scrutiny or full public disclosure. Data in the table are from the Stockholm International Peace Research Institute (SIPRI), which has adopted a definition of military expenditure derived from the North Atlantic Treaty Organization (NATO) definition (see *Definitions*). Therefore, the data in the table may differ from comparable data published by national governments. For a more detailed discussion of military expenditures, see *About the data* for table 5.7.

Along with public sector efforts, private sector development and investment, especially in competitive markets, has tremendous potential to contribute to growth and poverty reduction. The World Bank's Enterprise Surveys review the business environment, assessing constraints to private sector growth and enterprise performance. In some countries doing business requires informal payments to "get things done" in customs, taxes, licenses, regulations, services, and the like. Crime, theft, and disorder also

impose costs on businesses and society. And in many developing countries informal businesses operate without licenses. These firms have less access to financial and public services and can engage in fewer types of contracts and investments, constraining growth. The table presents data on the loss of sales due to theft, robbery, vandalism, and arson and on the percentage of firms operating informally. For further information on enterprise surveys, see *About the data* for table 5.2.

As the table shows, the human toll of armed violence across various contexts is severe. Additionally, in countries with fragile situations weak institutional capacity often results in poor performance and failure to meet expectations of effective service delivery. Failure to deliver water, health, and education services can weaken struggling governments. The table includes several indicators related to living conditions in fragile situations; children in employment. refugees, internally displaced persons, access to water and sanitation, maternal and under-five mortality, depth of hunger, and primary school enrollment. For more detailed information on these indicators, see About the data for table 2.6 (children in employment), table 6.18 (refugees), table 2.18 (access to improved water and sanitation), table 2.19 (maternal mortality), table 2.22 (under-five mortality), and table 2.12 (primary school enrollment).

Definitions

• International Development Association Resource Allocation Index is from the Country Policy and Institutional Assessment rating, which is the average score of four clusters of indicators designed to measure macroeconomic, governance, social, and structural dimensions of development: economic management, structural policies, policies for social inclusion and equity, and public sector management and institutions (see table 5.9). Countries are rated on a scale of 1 (low) to 6 (high). . Peacebuilding and peacekeeping refer to operations that engage in peacebuilding (reducing the risk of lapsing or relapsing into conflict by strengthening national capacities for conflict management and laying the foundation for sustainable peace and development) or peacekeeping (providing essential security to preserve the peace where fighting has been halted and to assist in implementing agreements achieved by the peacemakers). UN peacekeeping operations are authorized by the UN Secretary-General and planned, managed. directed, and supported by the United Nations Department of Peacekeeping Operations and the

Department of Field Support. The UN Charter gives the Security Council primary responsibility for maintaining international peace and security, including the establishment of a UN peacekeeping operation.

· Troops, police, and military observers in peacebuilding and peacekeeping refer to people active in peacebuilding and peacekeeping as part of an official operation. Peacekeepers deploy to war-torn regions where no one else is willing or able to go to prevent conflict from returning or escalating. • Battle-related deaths are deaths of members of warring parties in battle-related conflicts. Typically, battle-related deaths occur in warfare involving the armed forces of the warring parties (battlefield fighting, guerrilla activities, and all kinds of bombardments of military units, cities, and villages). The targets are usually the military and its installations or state institutions and state representatives, but there is often substantial collateral damage of civilians killed in crossfire, indiscriminate bombings, and other military activities. All deaths—civilian as well as military incurred in such situations are counted as battlerelated deaths. • Intentional homicides are estimates of unlawful homicides purposely inflicted as a result of domestic disputes, interpersonal violence, violent conflicts over land resources, intergang violence over turf or control, and predatory violence and killing by armed groups. Intentional homicide does not include all intentional killing; the difference is usually in the organization of the killing. Individuals or small groups usually commit homicide, whereas killing in armed conflict is usually committed by fairly cohesive groups of up to several hundred members and is thus usually excluded. Data from the World Health Organization (WHO) are from public health sources; data from the United Nations Survey of Crime Trends and Operations of Criminal Justice Systems (CTS) and national sources are based on criminal justice sources. • Military expenditures are SIPRI data derived from the NATO definition, which includes all current and capital expenditures on the armed forces, including peacekeeping forces; defense ministries and other government agencies engaged in defense projects; paramilitary forces, if judged to be trained and equipped for military operations; and military space activities. Such expenditures include military and civil personnel, including retirement pensions and social services for military personnel; operation and maintenance; procurement; military research and development; and military aid (in the military expenditures of the donor country). Excluded are civil defense and current

Fragile situations

.8

expenditures for previous military activities, such as for veterans benefits, demobilization, and weapons conversion and destruction. This definition cannot be applied to all countries, however, since the necessary detailed information is missing in some cases for military budgets and off-budget military expenditures (for example, whether military budgets cover civil defense, reserves and auxiliary forces, police and paramilitary forces, and military pensions). • Survey year is the year in which the underlying data were collected. • Losses due to theft, robbery, vandalism, and arson are the estimated losses from those causes that occurred on business establishment premises calculated as a percentage of annual sales. • Firms formally registered when operations started are the percentage of firms formally registered when they started operations in the country. • Children in employment are children involved in any economic activity for at least one hour in the reference week of the survey. • Refugees are people who are recognized as refugees under the 1951 Convention Relating to the Status of Refugees or its 1967 Protocol, the 1969 Organization of African Unity Convention Governing the Specific Aspects of Refugee Problems in Africa, people recognized as refugees in accordance with the UN Refugee Agency (UNHCR) statute, people granted refugee-like humanitarian status, and people provided temporary protection. Asylum seekers-people who have applied for asylum or refugee status and who have not yet received a decision, or who are registered as asylum seekers—are excluded. Palestinian refugees are people (and their descendants) whose residence was Palestine between June 1946 and May 1948 and who lost their homes and means of livelihood as a result of the 1948 Arab-Israeli conflict. • Country of origin refers to the nationality or country of citizenship of a claimant. • Country of asylum is the country where an asylum claim was filed and granted. • Internally displaced persons are people or groups of people who have been forced to leave their homes or places of habitual residence, in particular as a result of armed conflict, or to avoid the effects of armed conflict, situations of generalized violence, violations of human rights, or natural or human-made disasters and who have not crossed an international border. UNHCR statistics for this population include conflict-generated internally displaced persons to whom UNHCR extends protection or assistance and people in an internally displaced person-like situation. • Access to an improved water source refers to people with reasonable access to water from an

improved source, such as piped water into a dwelling, public tap, tubewell, protected dug well, and rainwater collection. Reasonable access is the availability of at least 20 liters a person a day from a source within 1 kilometer of the dwelling. • Access to improved sanitation facilities refers to people with at least adequate access to excreta disposal facilities that can effectively prevent human, animal, and insect contact with excreta, Improved facilities range from protected pit latrines to flush toilets. • Maternal mortality ratio is the number of women who die from pregnancy-related causes during pregnancy and childbirth per 100,000 live births. National estimates are based on national surveys, vital registration records, and surveillance data or are derived from community and hospital records. Modeled estimates are based on an exercise by the WHO. United Nations Children's Fund (UNICEF), United Nations Population Fund (UNFPA), and the World Bank. See About the data for table 2.19 for further details. • Under-five mortality rate is the probability per 1,000 that a newborn baby will die before reaching age 5, if subject to current age-specific mortality rates • Depth of hunger, or the intensity of food deprivation, indicates how much people who are food-deprived fall short of minimum food needs in terms of dietary energy. It is measured by comparing the average amount of dietary energy that undernourished people get from the foods they eat with the minimum amount of dietary energy they need to maintain body weight and undertake light activity. Depth of hunger is low when it is less than 200 kilocalories per person per day and high when it is above 300. • Primary gross enrollment ratio is the ratio of total enrollment, regardless of age, to the population of the age group that officially corresponds to the primary level of education. Primary education provides children with basic reading, writing, and mathematics skills along with an elementary understanding of such subjects as history, geography, natural science, social science, art, and music.

Data sources

Data on the International Development Association Resource Allocation Index are from the World Bank Group's International Development Association database (www.worldbank.org/ida). Data on peacebuilding and peacekeeping operations are from the UN Department of Peacekeeping Operations. Data on battle-related deaths are

from the Uppsala Conflict Data Program (www. pcr.uu.se/research/UCDP/index.htm). Data on intentional homicides are from the UN Office on Drugs and Crime's International Homicide Statistics database. Data on military expenditures are from SIPRI's Yearbook 2009: Armaments, Disarmament, and International Security and database (www.sipri.org/databases/milex). Data on the business environment are from the World Bank's Enterprise Surveys (www.enterprisesurveys.org). Data on children in employment are estimates produced by the Understanding Children's Work project based on household survey data sets made available by the International Labour Organization's International Programme on the Elimination of Child Labour under its Statistical Monitoring Programme on Child Labour, UNICEF under its Multiple Indicator Cluster Survey program, the World Bank under its Living Standards Measurement Study program, and national statistical offices (see table 2.6). Data on refugees and internally displaced persons are from the UNHCR's Statistical Yearbook 2008, complemented by statistics on Palestinian refugees under the mandate of the United Nations Relief and Works Agency for Palestine Refugees in the Near East as published on its website (www.unrwa.org). Data on access to water and sanitation are from the WHO and UNICEF's Progress on Drinking Water and Sanitation (2008). National estimates of maternal mortality are from UNICEF's The State of the World's Children 2009 and Childinfo and Demographic and Health Surveys by Macro International. Modeled estimates for maternal mortality are from WHO, UNICEF, UNFPA, and the World Bank's Maternal Mortality in 2005 (2007). Data on under-five mortality estimates by the Inter-agency Group for Child Mortality Estimation (which comprises UNICEF, WHO, the World Bank, United Nations Population Division. and other universities and research institutes) and are based mainly on household surveys, censuses, and vital registration data, supplemented by the World Bank's Human Development Network estimates based on vital registration and sample registration data (see table 2.22). Data on depth of hunger are from the Food and Agriculture Organization's Food Security Statistics (www.fao.org/ economic/ess/food-security-statistics/en/). Data on primary gross enrollment are from the United Nations Educational, Scientific, and Cultural Organization's Institute for Statistics.

About the data

The International Development Association (IDA) is the part of the World Bank Group that helps the poorest countries reduce poverty by providing concessional loans and grants for programs aimed at boosting economic growth and improving living conditions. IDA funding helps these countries deal with the complex challenges they face in meeting the Millennium Development Goals.

The World Bank's IDA Resource Allocation Index (IRAI), presented in the table, is based on the results of the annual Country Policy and Institutional Assessment (CPIA) exercise, which covers the IDA-eligible countries. The table does not include Kosovo, Liberia, Myanmar, and Somalia because they were not rated in the 2008 exercise even though they are

IDA eligible. Country assessments have been carried out annually since the mid-1970s by World Bank staff. Over time the criteria have been revised from a largely macroeconomic focus to include governance aspects and a broader coverage of social and structural dimensions. Country performance is assessed against a set of 16 criteria grouped into four clusters: economic management, structural policies, policies for social inclusion and equity, and public sector management and institutions. IDA resources are allocated to a country on per capita terms based on its IDA country performance rating and, to a limited extent, based on its per capita gross national income. This ensures that good performers receive a

higher IDA allocation in per capita terms. The IRAI is a key element in the country performance rating.

The CPIA exercise is intended to capture the quality of a country's policies and institutional arrangements, focusing on key elements that are within the country's control, rather than on outcomes (such as economic growth rates) that are influenced by events beyond the country's control. More specifically, the CPIA measures the extent to which a country's policy and institutional framework supports sustainable growth and poverty reduction and, consequently, the effective use of development assistance.

All criteria within each cluster receive equal weight, and each cluster has a 25 percent weight in the over-

all score, which is obtained by averaging the average scores of the four clusters. For each of the 16 criteria countries are rated on a scale of 1 (low) to 6 (high). The scores depend on the level of performance in a given year assessed against the criteria, rather than on changes in performance compared with the previous year. All 16 CPIA criteria contain a detailed description of each rating level. In assessing country performance, World Bank staff evaluate the country's performance on each of the criteria and assign a rating. The ratings reflect a variety of indicators, observations, and judgments based on country knowledge and on relevant publicly available indicators. In interpreting the assessment scores, it

should be noted that the criteria are designed in a developmentally neutral manner. Accordingly, higher scores can be attained by a country that, given its stage of development, has a policy and institutional framework that more strongly fosters growth and poverty reduction.

The country teams that prepare the ratings are very familiar with the country, and their assessments are based on country diagnostic studies prepared by the World Bank or other development organizations and on their own professional judgment. An early consultation is conducted with country authorities to make sure that the assessments are informed by up-to-date information. To ensure that scores are

consistent across countries, the process involves two key phases. In the benchmarking phase a small representative sample of countries drawn from all regions is rated. Country teams prepare proposals that are reviewed first at the regional level and then in a Bankwide review process. A similar process is followed to assess the performance of the remaining countries, using the benchmark countries' scores as guideposts. The final ratings are determined following a Bankwide review. The overall numerical IRAI score and the separate criteria scores were first publicly disclosed in June 2006.

See IDA's website at www.worldbank.org/ida for more information.

Definitions

• International Development Association Resource Allocation Index is obtained by calculating the average score for each cluster and then by averaging those scores. For each of 16 criteria countries are rated on a scale of 1 (low) to 6 (high) • Economic management cluster: Macroeconomic management assesses the monetary, exchange rate, and aggregate demand policy framework. • Fiscal policy assesses the short- and medium-term sustainability of fiscal policy (taking into account monetary and exchange rate policy and the sustainability of the public debt) and its impact on growth. • Debt policy assesses whether the debt management strategy is conducive to minimizing budgetary risks and ensuring

long-term debt sustainability. • Structural policies cluster: Trade assesses how the policy framework fosters trade in goods. • Financial sector assesses the structure of the financial sector and the policies and regulations that affect it. • Business regulatory environment assesses the extent to which the legal, regulatory, and policy environments help or hinder private businesses in investing, creating jobs, and becoming more productive. • Policies for social inclusion and equity cluster: Gender equality assesses the extent to which the country has installed institutions and programs to enforce laws and policies that promote equal access for men and women in education, health, the economy, and

protection under law. • Equity of public resource use assesses the extent to which the pattern of public expenditures and revenue collection affects the poor and is consistent with national poverty reduction priorities. • Building human resources assesses the national policies and public and private sector service delivery that affect the access to and quality of health and education services, including prevention and treatment of HIV/AIDS, tuberculosis, and malaria. • Social protection and labor assess government policies in social protection and labor market regulations that reduce the risk of becoming poor, assist those who are poor to better manage further risks, and ensure a minimal level of welfare

5.9

to all people. • Policies and institutions for environmental sustainability assess the extent to which environmental policies foster the protection and sustainable use of natural resources and the management of pollution. • Public sector management and institutions cluster: Property rights and rule-based governance assess the extent to which private economic activity is facilitated by an effective legal system and rule-based governance structure in which property and contract rights are reliably respected and enforced. • Quality of budgetary and financial management assesses the extent to which there is a comprehensive and credible budget linked to policy priorities, effective financial management systems,

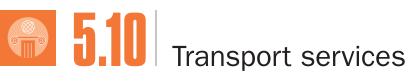

and timely and accurate accounting and fiscal reporting, including timely and audited public accounts.

• Efficiency of revenue mobilization assesses the overall pattern of revenue mobilization—not only the de facto tax structure, but also revenue from all sources as actually collected. • Quality of public administration assesses the extent to which civilian central government staff is structured to design and implement government policy and deliver services effectively. • Transparency, accountability, and corruption in the public sector assess the extent to which the executive can be held accountable for its use of funds and for the results of its actions by the electorate, the legislature, and the judiciary and the

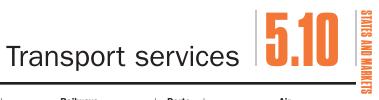

extent to which public employees within the executive are required to account for administrative decisions, use of resources, and results obtained. The three main dimensions assessed are the accountability of the executive to oversight institutions and of public employees for their performance, access of civil society to information on public affairs, and state capture by narrow vested interests.

Data sources

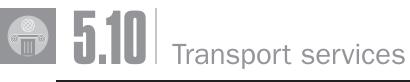

Data on public policies and institutions are from the World Bank Group's CPIA database available at www.worldbank.org/ida.

a. Data are for the latest year available in the period shown. b. Includes Tazara railway. c. Refers to class 1 railways only. d. Covers only carriers designated by the U.S. Department of Transportation as major and national air carriers.

About the data

Transport infrastructure—highways, railways, ports and waterways, and airports and air traffic control systems-and the services that flow from it are crucial to the activities of households, producers, and governments. Because performance indicators vary widely by transport mode and focus (whether physical infrastructure or the services flowing from that infrastructure), highly specialized and carefully specified indicators are required. The table provides selected indicators of the size, extent, and productivity of roads, railways, and air transport systems and of the volume of traffic in these modes as well as in ports.

Data for transport sectors are not always internationally comparable. Unlike for demographic statistics, national income accounts, and international trade data, the collection of infrastructure data has not been "internationalized." But data on roads are collected by the International Road Federation (IRF). and data on air transport by the International Civil Aviation Organization (ICAO).

National road associations are the primary source of IRF data. In countries where a national road association is lacking or does not respond, other agencies are contacted, such as road directorates, ministries of transport or public works, or central statistical offices. As a result, definitions and data collection methods and quality differ, and the compiled data are of uneven quality. Moreover, the quality of transport service (reliability, transit time, and condition of goods delivered) is rarely measured, though it may be as important as quantity in assessing an economy's transport system.

Unlike the road sector, where numerous qualified motor vehicle operators can operate anywhere on the road network, railways are a restricted transport system with vehicles confined to a fixed guideway. Considering the cost and service characteristics, railways generally are best suited to carry—and can effectively compete for-bulk commodities and containerized freight for distances of 500-5,000 kilometers, and passengers for distances of 50–1,000 kilometers. Below these limits road transport tends to be more competitive, while above these limits air transport for passengers and freight and sea transport for freight tend to be more competitive. The railways indicators in the table focus on scale and output measures: total route-kilometers, passenger-kilometers, and goods (freight) hauled in ton-kilometers.

Measures of port container traffic, much of it commodities of medium to high value added, give

some indication of economic growth in a country. But when traffic is merely transshipment, much of the economic benefit goes to the terminal operator and ancillary services for ships and containers rather than to the country more broadly. In transshipment centers empty containers may account for as much as 40 percent of traffic.

The air transport data represent the total (international and domestic) scheduled traffic carried by the air carriers registered in a country. Countries submit air transport data to ICAO on the basis of standard instructions and definitions issued by ICAO. In many cases, however, the data include estimates by ICAO for nonreporting carriers. Where possible, these estimates are based on previous submissions supplemented by information published by the air carriers, such as flight schedules.

The data cover the air traffic carried on scheduled services, but changes in air transport regulations in Europe have made it more difficult to classify traffic as scheduled or nonscheduled. Thus recent increases shown for some European countries may be due to changes in the classification of air traffic rather than actual growth. For countries with few air carriers or only one, the addition or discontinuation of a home-based air carrier may cause significant changes in air traffic.

Definitions

· Total road network covers motorways, highways, main or national roads, secondary or regional roads, and all other roads in a country. • Paved roads are roads surfaced with crushed stone (macadam) and hydrocarbon binder or bituminized agents, with concrete, or with cobblestones. • Passengers carried by road are the number of passengers transported by road times kilometers traveled. • Goods hauled by road are the volume of goods transported by road vehicles, measured in millions of metric tons times kilometers traveled. • Rail lines are the length of railway route available for train service, irrespective of the number of parallel tracks. • Passengers carried by railway are the number of passengers transported by rail times kilometers traveled. • Goods hauled by railway are the volume of goods transported by railway, measured in metric tons times kilometers traveled. • Port container traffic measures the flow of containers from land to sea transport modes and vice versa in twenty-foot-equivalent units (TEUs), a standard-size container. Data cover coastal shipping as well as international journeys. Transshipment traffic is counted as two lifts at the intermediate port (once to off-load and again as an outbound lift) and includes empty units. • Registered carrier departures worldwide are domestic takeoffs and takeoffs abroad of air carriers registered in the country. • Passengers carried by air include both domestic and international passengers of air carriers registered in the country. • Air freight is the volume of freight, express, and diplomatic bags carried on each flight stage (operation of an aircraft from takeoff to its next landing), measured in metric tons times kilometers traveled.

Data sources

Data on roads are from the IRF's World Road Statistics, supplemented by World Bank staff estimates. Data on railways are from a database maintained by the World Bank's Transport and Urban Development Department, Transport Division, based on data from the International Union of Railways. Data on port container traffic are from Containerisation International's Containerisation International Yearbook. Data on air transport are from the ICAO's Civil Aviation Statistics of the World and ICAO staff estimates.

a. Data are from the International Telecommunication Union's (ITU) World Telecommunication Development Report database. Please cite the ITU for third-party use of these data.

About the data

The quality of an economy's infrastructure, including power and communications, is an important element in investment decisions for both domestic and foreign investors. Government effort alone is not enough to meet the need for investments in modern infrastructure; public-private partnerships, especially those involving local providers and financiers, are critical for lowering costs and delivering value for money. In telecommunications, competition in the marketplace, along with sound regulation, is lowering costs, improving quality, and easing access to services around the globe.

An economy's production and consumption of electricity are basic indicators of its size and level of development. Although a few countries export electric power, most production is for domestic consumption. Expanding the supply of electricity to meet the growing demand of increasingly urbanized and industrialized economies without incurring unacceptable social, economic, and environmental costs is one of the great challenges facing developing countries.

Data on electric power production and consumption are collected from national energy agencies by the International Energy Agency (IEA) and adjusted by the IEA to meet international definitions (for data on electricity production, see table 3.10). Electricity consumption is equivalent to production less power plants' own use and transmission, distribution, and transformation losses less exports plus imports. It includes consumption by auxiliary stations, losses in transformers that are considered integral parts of those stations, and electricity produced by pumping installations. Where data are available, it covers electricity generated by primary sources of energy coal, oil, gas, nuclear, hydro, geothermal, wind, tide and wave, and combustible renewables. Neither production nor consumption data capture the reliability of supplies, including breakdowns, load factors, and frequency of outages.

Over the past decade new financing and technology, along with privatization and liberalization, have spurred dramatic growth in telecommunications in many countries. With the rapid development of mobile telephony and the global expansion of the Internet, information and communication technologies are increasingly recognized as essential tools of development, contributing to global integration and enhancing public sector effectiveness, efficiency, and transparency. The table presents telecommunications indicators covering access and use, quality, and affordability and efficiency.

Access to telephone services rose on an unprecedented scale over the past 15 years. This growth was driven primarily by wireless technologies and liberalization of telecommunications markets, which have enabled faster and less costly network rollout. In 2002 the number of mobile phones in the world surpassed the number of fixed telephones; by the end of 2008 there were an estimated 4 billion mobile phones globally. No technology has ever spread faster around the world. Mobile communications have had a particularly important impact in rural areas. The mobility, ease of use, flexible deployment, and relatively low and declining rollout costs of wireless technologies enable them to reach rural populations with low levels of income and literacy. The next billion mobile subscribers will consist mainly of the rural poor.

Access is the key to delivering telecommunications services to people. If the service is not affordable to most people, goals of universal usage will not be met. Two indicators of telecommunications affordability are presented in the table: fixed-line telephone service tariff and prepaid mobile cellular service tariff. Telecommunications efficiency is measured by total telecommunications revenue divided by GDP and by mobile cellular and fixed-line telephone subscribers per employee.

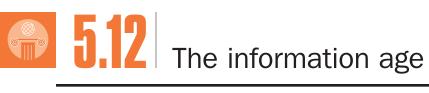

Operators have traditionally been the main source of telecommunications data, so information on subscribers has been widely available for most countries. This gives a general idea of access, but a more precise measure is the penetration rate—the share of households with access to telecommunications. During the past few years more information on information and communication technology use has become available from household and business surveys. Also important are data on actual use of telecommunications equipment. Ideally, statistics on telecommunications (and other information and communications technologies) should be compiled for all three measures: subscription and possession, access, and use. The quality of data varies among reporting countries as a result of differences in regulations covering data provision and availability.

Definitions

• Electric power consumption per capita measures the production of power plants and combined heat and power plants less transmission, distribution, and transformation losses and own use by heat and power plants divided by midyear population. • Electric power transmission and distribution losses are losses in transmission between sources of supply and points of distribution and in distribution to consumers, including pilferage. • Fixed telephone lines are telephone lines connecting a subscriber to the telephone exchange equipment. • Mobile cellular telephone subscriptions are subscriptions to a public mobile telephone service using cellular technology, which provide access to the public switched telephone network. Post-paid and prepaid subscriptions are included. • International voice traffic is the sum of international incoming and outgoing telephone traffic (in minutes) divided by total population. • Population covered by mobile cellular network is the percentage of people that live in areas served by a mobile cellular signal regardless of whether they use it. • Residential fixed-line tariff is the monthly subscription charge plus the cost of 30 three-minute local calls (15 peak and 15 off-peak). • Mobile cel-Iular prepaid tariff is based on the Organisation for Economic Co-operation and Development's low-user definition, which includes the cost of monthly mobile use for 25 outgoing calls per month spread over the same mobile network, other mobile networks, and mobile to fixed-line calls and during peak, off-peak, and weekend times as well as 30 text messages per month. • Telecommunications revenue is the revenue from the provision of telecommunications services such as fixed-line, mobile, and data divided by GDP. • Mobile cellular and fixed-line subscribers per employee are telephone subscribers (fixed-line plus mobile) divided by the total number of telecommunications employees.

Data sources

Data on electricity consumption and losses are from the IEA's Energy Statistics and Balances of Non-OECD Countries 2009, the IEA's Energy Statistics of OECD Countries 2009, and the United Nations Statistics Division's Energy Statistics Yearbook. Data on telecommunications are from the International Telecommunication Union's World Telecommunication Development Report database and World Bank estimates.

a. Data are from the International Telecommunication Union's (ITU) World Telecommunication Development Report database. Please cite the ITU for third-party use of these data. b. Data are for the most recent year available.

About the data

The digital and information revolution has changed the way the world learns, communicates, does business, and treats illnesses. New information and communications technologies (ICT) offer vast opportunities for progress in all walks of life in all countries—opportunities for economic growth, improved health, better service delivery, learning through distance education, and social and cultural advances.

Comparable statistics on access, use, quality, and affordability of ICT are needed to formulate growth-enabling policies for the sector and to monitor and evaluate the sector's impact on development. Although basic access data are available for many countries, in most developing countries little is known about who uses ICT; what they are used for (school, work, business, research, government); and how they affect people and businesses. The global Partnership on Measuring ICT for Development is helping to set standards, harmonize information and communications technology statistics, and build statistical capacity in developing countries. For more information see www.itu.int/ITU-D/ict/partnership/.

Data on daily newspapers in circulation are from United Nations Educational, Scientific, and Cultural Organization (UNESCO) Institute for Statistics surveys on circulation, online newspapers, journalists, community newspapers, and news agencies.

Estimates of households with television are derived from household surveys. Some countries report only the number of households with a color television set, and so the true number may be higher than reported.

Estimates of personal computers are from an annual International Telecommunication Union (ITU) questionnaire sent to member states, supplemented by other sources. Many governments lack the capacity to survey all places where personal computers are used (homes, schools, businesses, government offices, libraries, Internet cafes) so most estimates are derived from the number of personal computers sold each year. Annual shipment data can also be multiplied by an estimated average useful lifespan before replacement to approximate the number of personal computers. There is no precise method for determining replacement rates, but in general personal computers are replaced every three to five years.

Data on Internet users and related indicators (broadband and bandwidth) are based on nationally reported data to the ITU. Some countries derive these data from surveys, but since survey questions and definitions differ, the estimates may not be strictly comparable. Countries without surveys generally derive their estimates by multiplying subscriber counts reported by Internet service providers by a multiplier. This method may undercount actual users,

particularly in developing countries, where many commercial subscribers rent out computers connected to the Internet or prepaid cards are used to access the Internet.

Broadband refers to technologies that provide Internet speeds of at least 256 kilobits a second of upstream and downstream capacity and includes digital subscriber lines, cable modems, satellite broadband Internet, fiber-to-home Internet access, ethernet local access networks, and wireless area networks. Bandwidth refers to the range of frequencies available for signals. The higher the bandwidth, the more information that can be transmitted at one time. Reporting countries may have different definitions of broadband, so data are not strictly comparable.

The number of secure Internet servers, from the Netcraft Secure Server Survey, indicates how many companies conduct encrypted transactions over the Internet. The survey examines the use of encrypted transactions through extensive automated exploration, tallying the number of Web sites using a secure socket layer (SSL). The country of origin of about a third of the 1.2 million distinct valid third-party certificates is unknown. Some countries, such as the Republic of Korea, use application layers to establish the encryption channel, which is SSL equivalent.

According to the World Information Technology and Services Alliance's (WITSA) *Digital Planet 2009*, the global marketplace for information and communications technologies was estimated to be about \$3.4 trillion in 2009 and to rise to about \$3.6 trillion in 2010. The data on information and communications technology expenditures cover the world's 75 largest buyers among countries and regions.

Information and communication technology goods exports and imports are defined by the Working Party on Indicators for the Information Society and are reported in the Organisation for Economic Cooperation and Development's *Guide to Measuring the Information Society* (2005). Information and communication technology service exports data are based on the International Monetary Fund's (IMF) *Balance of Payments Statistics Yearbook* classification.

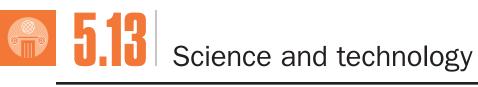

Definitions

• Daily newspapers are newspapers issued at least four times a week that report mainly on events in the 24-hour period before going to press. The indicator is average circulation (or copies printed) per 1,000 people. • Households with television are the percentage of households with a television set. • Personal computers are self-contained computers designed for use by a single individual, including laptops and notebooks and excluding terminals connected to mainframe and

minicomputers intended primarily for shared use and devices such as smart phones and personal digital assistants. • Internet users are people with access to the worldwide network. • Fixed broadband Internet subscribers are the number of broadband subscribers with a digital subscriber line, cable modem, or other high-speed technology. • International Internet bandwidth is the contracted capacity of international connections between countries for transmitting Internet traffic. • Fixed broadband Internet access tariff is the lowest sampled cost per 100 kilobits a second per month and are calculated from low- and high-speed monthly service charges. Monthly charges do not include installation fees or modem rentals. . Secure Internet servers are servers using encryption technology in Internet transactions. . Information and communications technology expenditures include computer hardware (computers, storage devices, printers, and other peripherals); computer software (operating systems, programming tools, utilities, applications, and internal software development); computer services (information technology consulting, computer and network systems integration, Web hosting, data processing services, and other services); and communications services (voice and data communications services) and wired and wireless communications equipment. • Information and communication technology goods exports and imports include telecommunications, audio and video, computer and related equipment; electronic components; and other information and communication technology goods. Software is excluded. • Information and communication technology service exports include computer and communications services (telecommunications and postal and courier services) and information services (computer data and news-related service transactions).

Data sources

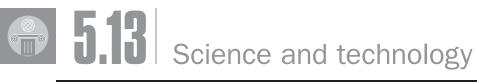

Data on newspapers are compiled by the UNESCO Institute for Statistics, Data on televisions, personal computers, Internet users, Internet broadband users and cost, and Internet bandwidth are from the ITU's World Telecommunication Development Report database. Data on secure Internet servers are from Netcraft (www.netcraft.com/) and official government sources. Data on information and communication technology goods trade are from the United Nations Statistics Division's Commodity Trade (Comtrade) database. Data on information and communication technology expenditures are from WITSA's Digital Planet 2009 and Global Insight, Inc. Data on information and communication technology service exports are from the IMF's Balance of Payments Statistics database.

a. Original information was provided by the World Intellectual Property Organization (WIPO). The International Bureau of WIPO assumes no responsibility with respect to the transformation of these data. b. Excludes applications filed under the auspices of the African Regional Intellectual Property Organization (11 by residents, 424 by nonresidents), the European Patent Office (146,150 by nonresidents), and the Eurasian Patent Organization (3,066 by nonresidents). c. Excludes applications filed under the auspices of the Office for Harmonization in the Internal Market (87,640). d. Data are for the most recent year available. e. Includes Luxembourg and the Netherlands.

About the data

Science and technology is too broad and complex to quantify with a single set of indicators, but those in the table shed light on countries' technology base. Technological innovation, often fueled by government-led research and development (R&D), has been the driving force for industrial growth. The best opportunities to improve living standards come from science and technology. Countries able to access, generate, and apply scientific knowledge have a competitive edge. And high-quality scientific input improves public policy.

The United Nations Educational, Scientific, and Cultural Organization (UNESCO) Institute for Statistics collects data on researchers, technicians, and expenditure on R&D through surveys and from other international sources. R&D covers basic research, applied research, and experimental development. Data on researchers and technicians are calculated as full-time equivalents.

Scientific and technical article counts are from journals classified by the Institute for Scientific Information's Science Citation Index (SCI) and Social Sciences Citation Index (SSCI). Counts are based on fractional assignments; articles with authors from different countries are allocated proportionally to each country (see Definitions for fields covered). The SCI and SSCI databases cover the core set of scientific journals but may exclude some of local importance and may reflect some bias toward English-language journals.

R&D expenditures include all expenditures for R&D performed within a country, including capital costs and current costs (wages and associated costs of researchers, technicians, and supporting staff and other current costs, including noncapital purchases of materials, supplies, and R&D equipment such as utilities, reference materials, subscriptions to libraries and scientific societies, and lab materials).

The method for determining high-technology exports was developed by the Organisation for Economic Cooperation and Development in collaboration with Eurostat. It takes a "product approach" (as distinguished from a "sectoral approach") based on R&D intensity (R&D expenditure divided by total sales) for groups of products from Germany, Italy, Japan, the Netherlands, Sweden, and the United States. Because industrial sectors specializing in a few high-technology products may also produce low-technology products, the product approach is more appropriate for analyzing international trade. This method takes only R&D intensity into account, but other characteristics of high technology are also important, such as know-how, scientific personnel, and technology embodied in patents. Considering these characteristics would yield a different list (see Hatzichronoglou 1997).

A patent is an exclusive right granted for a specified period (generally 20 years) for a new way of doing something or a new technical solution to a problem an invention. The invention must be of practical use and display a characteristic unknown in the existing body of knowledge in its field.

Most countries have systems to protect patentable inventions. The Patent Cooperation Treaty provides a two-phase system for filing patent applications. An applicant files an international application and designates the countries in which protection is sought (all eligible countries are automatically designated in every application under the treaty). The application is searched and published, and, optionally, an international preliminary examination is conducted. In the national (or regional) phase the applicant requests national processing of the application and initiates the national search and granting procedure. International applications under the treaty provide for a national patent grant only—there is no international patent. The national filing represents the applicant's seeking of patent protection for a given territory, whereas international filings, while representing a legal right, do not accurately reflect where patent protection is sought. Resident filings are those from residents of the country or region concerned. Nonresident filings are from outside applicants. For regional offices such as the European Patent Office, applications from residents of any member state of the regional patent convention are considered a resident filing. Some offices (notably the U.S. Patent and Trademark Office) use the residence of the inventor rather than the applicant to classify filings.

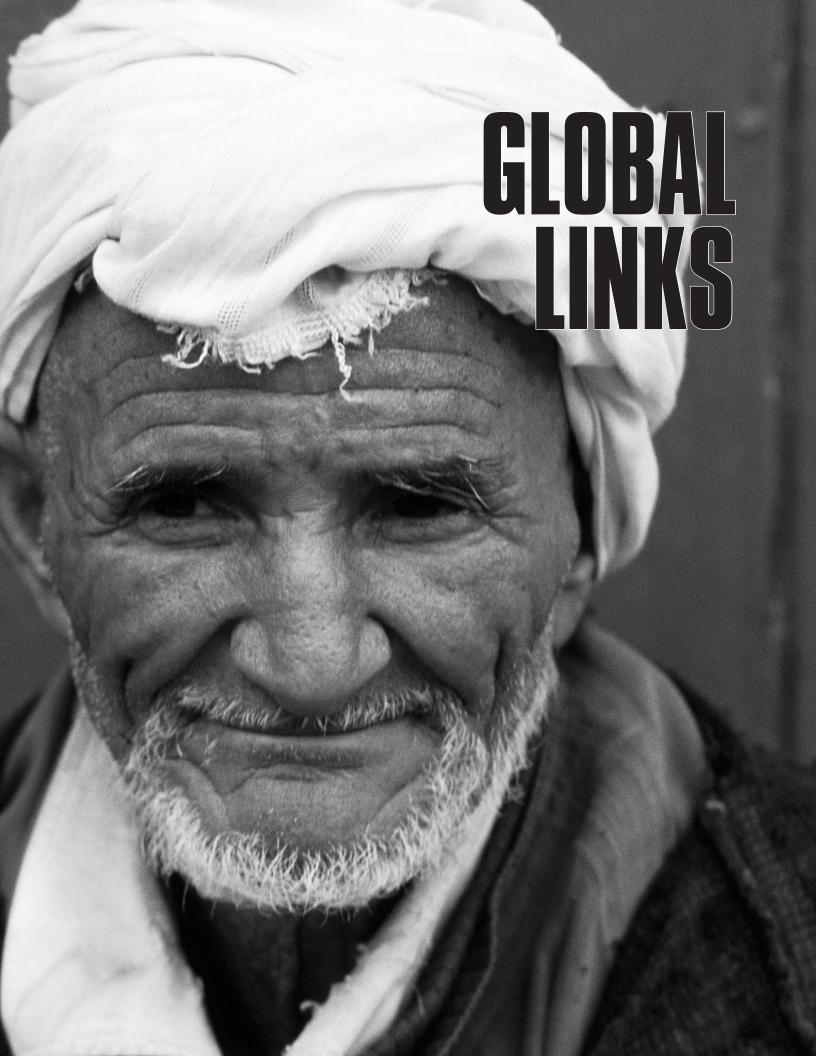

A trademark is a distinctive sign identifying goods or services as produced or provided by a specific person or enterprise. A trademark protects the owner of the mark by ensuring exclusive right to use it to identify goods or services or to authorize another to use it. The period of protection varies, but a trademark can be renewed indefinitely for an additional fee. Detailed components of trademark filings, available on the World Development Indicators CD-ROM and WDI Online, include applications filed by direct residents (domestic applicants filing directly at a given national intellectual property [IP] office); direct nonresident (foreign applicants filing directly at a given national IP office); aggregate direct (applicants not identified as direct resident or direct nonresident by the national office); and Madrid (international applications filed via the World Intellectual Property Organization (WIPO)-administered Madrid System to the national or regional IP office). Data are based on information supplied to WIPO by IP offices in annual surveys, supplemented by data in national IP office reports. Data may be missing for some offices or periods.

Definitions

· Researchers in R&D are professionals engaged in conceiving of or creating new knowledge, products, processes, methods, and systems and in managing the projects concerned. Postgraduate doctoral students (ISCED97 level 6) engaged in R&D are considered researchers. • Technicians in R&D and equivalent staff are people whose main tasks require technical knowledge and experience in engineering, physical and life sciences (technicians), and social sciences and humanities (equivalent staff). They engage in R&D by performing scientific and technical tasks involving the application of concepts and operational methods, normally under researcher supervision. • Scientific and technical journal articles are published articles in physics, biology, chemistry, mathematics, clinical medicine, biomedical research, engineering and technology, and earth and space sciences. • Expenditures for R&D are current and capital expenditures on creative work undertaken to increase the stock of knowledge. including on humanity, culture, and society, and the use of knowledge to devise new applications. • Hightechnology exports are products with high R&D intensity, such as in aerospace, computers, pharmaceuticals, scientific instruments, and electrical machinery. · Royalty and license fees are payments and receipts between residents and nonresidents for authorized use of intangible, nonproduced, nonfinancial assets and proprietary rights (such as patents, copyrights, trademarks, and industrial processes) and for the use, through licensing, of produced originals of prototypes (such as films and manuscripts). • Patent applications filed are worldwide patent applications filed through the Patent Cooperation Treaty procedure or with a national patent office. • Trademark applications filed are annual applications to register a trademark with a national or regional IP office.

Data sources

Data on R&D are provided by the UNESCO Institute for Statistics. Data on scientific and technical journal articles are from the U.S. National Science Board's Science and Engineering Indicators 2008. Data on high-technology exports are from the United Nations Statistics Division's Commodity Trade (Comtrade) database. Data on royalty and license fees are from the International Monetary Fund's Balance of Payments Statistics Yearbook. Data on patents and trademarks are from the World Intellectual Property Organization's WIPO Patent Report: Statistics on Worldwide Patent Activity (2009) and www.wipo.int.

he Millennium Development Goals (MDGs) recognize that expanding international trade can help developing economies achieve the MDGs by fostering economic growth and increasing job opportunities. At the 2000 Millennium Summit developed countries agreed to increase market access for developing countries by lowering tariffs and granting tariff-free access to all goods (except weapons). They also agreed to increase aid for promoting trade and to decrease domestic agricultural subsidies that harm imports from developing economies.

The world today is a more integrated place than in 1990—the MDGs benchmark year. World exports of goods and services nearly tripled between 1990 and 2007—a 7 percent annual average growth rate—and foreign direct investment increased ninefold between 1990 and 2008. More people are moving abroad (temporarily or permanently), more investors are buying foreign stocks, and more companies are expanding to overseas markets. And developing economies' trade has expanded from 17.3 percent of world exports and 17.0 percent of world imports in 1990 to 28.1 percent of exports and 25.9 percent of imports in 2007.

Though all economies may benefit from international integration, the benefits may not be shared equally among them. Successful integration depends partly on geography and natural resources: economies with substantial coastal areas or located near large economic centers may increase their share of the global market much faster than landlocked or isolated economies. And economies with abundant natural resources and cheap labor may attract foreign investors and grow faster than economies with fewer resources.

The question remains: can trade expansion and economic integration promote human development? Trade expansion provides developing economies with a larger market in which to sell goods and services, boosting production. But trade liberalization can also harm domestic industries by exposing them to fierce international competition. Trade expansion can promote rapid economic growth, potentially furthering human development. But greater engagement with international markets is sometimes accompanied by increased income inequality. Developing economies must consider how integration affects the most vulnerable segments of the population. Increased trade can accelerate progress toward the MDGs only if it both fosters economic growth and improves living standards for the poorest and most vulnerable.

Four MDG indicators track developed economies' commitments to increase market access for developing economies and support their programs to promote trade: the proportion of total developed country imports (by value and excluding arms) admitted free of duty from developing economies and least developed countries; average tariffs imposed by developed economies on agricultural products, textiles, and clothing from developing economies; agricultural support in Organisation for Economic Co-operation and Development (OECD) economies as a percentage of their gross domestic product (GDP); and the share of official development assistance provided to build trade capacity.

But these indicators are not enough to describe the many instruments of trade policy, the changing patterns of trade, and their impact on human development. This introduction looks beyond the MDG indicators to the characteristics of economies and their trade policies that may ultimately affect their success in achieving the MDGs.

Trade expansion and development

How does trade expansion affect human development and poverty? In theory, trade expansion should contribute directly to poverty reduction by increasing

the returns on the most abundant factor of production, which in developing economies tends to be low-skilled labor. But empirical studies disagree on the causal relationship between trade expansion and poverty reduction. Some studies find an increase in inequality after trade liberalization (World Bank and others 2005; UNDP 2005; Kremer and Maskin 2006). Others find that trade has a beneficial effect on poverty reduction—but may not be the most important factor (Billmeier and Nannicini 2007).

Despite the lack of agreement on the effects of trade expansion on poverty, economic theory and empirical evidence offer no reason to restrict trade. An increase in trade, especially exports, is associated with economic growth (figure 6a). This simple association between GDP growth and export growth overlooks differences between countries and other factors that affect economic growth. For example, small island economies may have to be more open in order to generate economic growth, while economies with sufficient domestic markets may require less export expansion to achieve economic growth. Analysis in World Development Indicators 2007 showed that for countries starting from similar positions, countries that opened their economy (as measured by the ratio of imports and exports of goods and services to GDP) less rapidly recorded much lower per capita GDP growth.

In recent years many economies, especially in East Asia, experienced rapid growth in GDP and exports. But did export expansion trigger this economic growth or are increasing exports an outcome of growth? Although economists do not agree on causality, most empirical evidence indicates that greater openness to trade is an important element explaining growth performance—and has been a central feature

Average annual growth of GDP, 2000–08 (percent)

of successful economic development (OECD 2009b; Commission on Growth and Development 2008).

Economies benefit from increased international trade because it allows them to produce commodities for which they have a comparative advantage, sell those goods in a larger world market, and import goods and services that are more costly to produce domestically. Export expansion increases output, generates jobs, and raises household income, which may in turn improve health and other living conditions. Trade expansion can also raise education standards by giving people greater incentives to improve their skills. Foreign direct investors that are initially attracted by developing economies' cheap and abundant labor supply may also introduce new technology and know-how, and foreign competition may spur productivity and efficiency gains. Exports generate the foreign exchange needed to finance critical imports and may increase government revenue through taxes that can be used to finance social protection programs. Economies with small domestic markets likely have lower welfare and growth rates if they isolate themselves from the international movement of goods, factors, people, and ideas.

But trade liberalization brings additional challenges for developing economies in managing their external accounts. Economies that import more than they export are vulnerable to trade imbalance. Eighty of 111 developing economies for which data are available had a negative trade balance in 2008. For 67 of them the trade balance to GDP ratio has deteriorated since 1990. The ratio has worsened by more than 5 percentage points for 44 economies and by more than 10 percentage points for 26 economies. Dependence on imports may put poor countries at risk for currency crises, especially if they have limited access to foreign capital. Many developing economies are sensitive to opening their economies to trade because they worry that liberalization might merely increase cheap imports and harm local businesses instead of creating new export enterprises.

Developing economies have increased their share of world trade

Developing economies have become more open, as measured by the ratio of trade (imports plus exports) to GDP, which rose from 34 percent in 1990 to 62 percent in 2008. Export revenues, constituting 30 percent of

developing economies' outputs in 2008 (up from 18 percent in 1990), are especially important for low-income economies (figure 6b). Developing economies increased their share of world trade from 16 percent of merchandise exports in 1990 to 33 percent in 2008 and from 12 percent of services exports in 1990 to 21 percent in 2008 (figure 6c). But the benefits were not shared equally. Low-income economies accounted for only 1 percent of world merchandise exports and less than 1 percent of world service exports in 2008.

Low-income exporters specialize in labor-intensive goods

Export-led growth can improve human development outcomes and reduce poverty if it fosters employment in labor-intensive sectors where the poor have a stake. As the share of agriculture and labor-intensive manufacturing—such as textiles, clothing, and footwear—in world exports has fallen, both developing and high-income economies have adjusted by moving to capital-intensive manufacturing. But low-income economies, following their comparative advantage, still specialize in labor-intensive exports (figure 6d), which face higher tariffs than do other products (figure 6e).

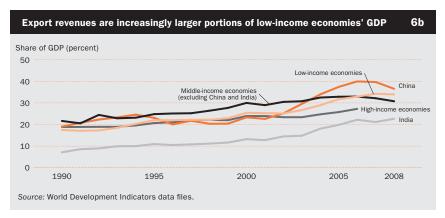

Transitioning from labor-intensive exports to capital-intensive exports may be difficult. Ideally, increased trade should mean more jobs, lower unemployment, and higher wages. But trade liberalization has often failed to improve employment because new export industries have been capital-intensive manufactures, unable to create sufficient employment to absorb all of the workers transitioning from the agriculture sector.

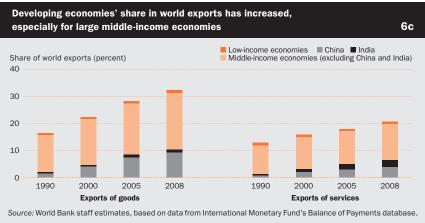

The poorest of the world's population live in rural areas and work in agriculture or fisheries. Boosting agricultural exports could increase agricultural employment and wages, thereby reducing poverty.

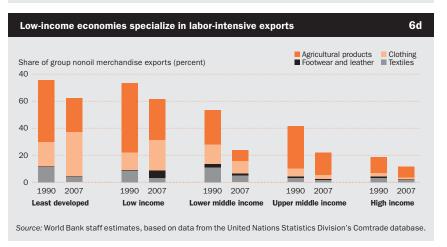

Most world trade in agriculture occurs between high-income economies, with low-income economies providing only about 2 percent of global agricultural exports (figure 6f). Developing economies have limited representation in global agricultural markets partly because their exports face higher tariffs from both high-income and developing economy partners. High-income economies also provide subsidies to their farmers, enabling them to sell agricultural products at very low prices that developing

economies cannot match. Under the MDG framework, OECD members promised to lower subsidies to agricultural producers, exporters, and consumers. Total agricultural supports as a share of GDP have fallen for most OECD members, but in nominal dollar terms support actually increased 3.2 percent between 2007 and 2008, to \$376 billion.

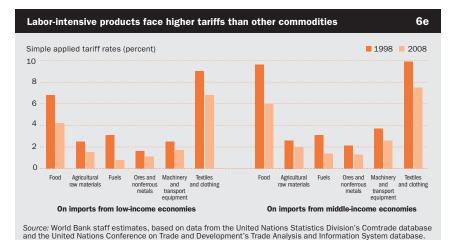

In the last decade some developing economies, especially the least developed countries, became net food importers. In the mid-1970s

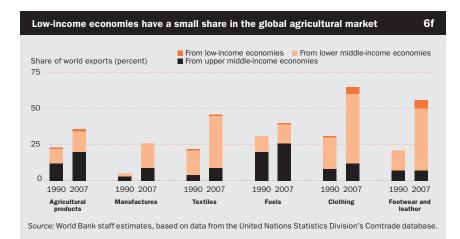

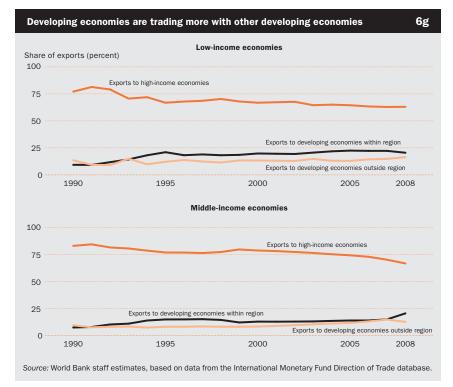

18 of 28 least developed countries were net food exporters; by the mid-1990s 7 of them had become net food importers; and by the mid-2000s 10 of them had become net food importers. Vulnerable to increasing food prices, net food importers can suffer food insecurity and malnutrition.

Trade diversification has improved—but unevenly

Trade diversification—in both partners and products—affects developing economies' ability to cope with external shocks such as commodity price changes and demand fluctuations.

Compared with two decades ago, developing economies are trading more with other developing economies, especially with economies in the same region (figure 6g). Developing economies' exports to other developing economies increased from 16 percent of merchandise exports in 1990 to 31 percent in 2008. Expansion of East Asia and Pacific and Sub-Saharan African economies' trade with other developing economies has been remarkable. East Asia and Pacific's exports to other developing economies rose from 13 percent of the region's total merchandise exports in 1990 to 29 percent in 2008. Sub-Saharan Africa's exports to other developing economies rose from 12 percent in 1990 to 37 percent in 2008. Still, more than 60 percent of developing economies' merchandise exports in 2008 were directed to high-income economies. The economic crisis that began in 2008 lowered developed economies' demand for imports, hurting the export revenues of developing economies that depended on high-income markets. Some economies, especially the poorest, depend on just a few partner economies. For example, more than 95 percent of the merchandise exports from Chad, Guinea-Bissau, and Niger in 2008 were directed to their five largest trading partners.

Many developing economies have improved their product diversification, but some remain dependent on only a few products. The top-five export commodities (which differ by country) made up around 75 percent of Sub-Saharan African economies' merchandise exports. And for some developing economies the top-five share exceeds 90 percent of total merchandise exports (figure 6h). On average, the share of the top-five export commodities in total exports tends to be higher for low-income economies

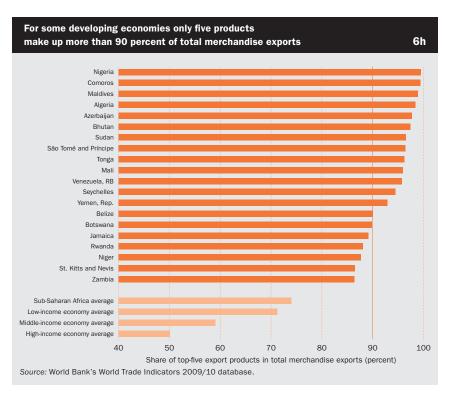

(71 percent) than for middle-income (59 percent) and high-income (50 percent) economies.

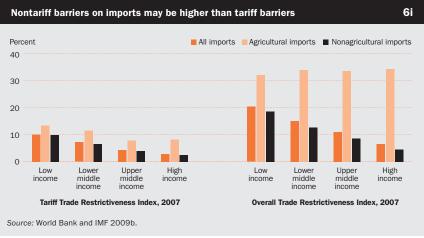

Developed economies have lowered trade barriers, but not enough

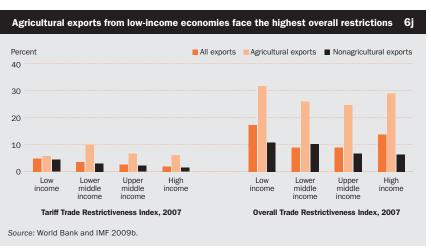

Trade barriers encompass tariffs, quotas, antidumping duties, export subsidies, monopolistic measures, and technical regulations. Measuring overall trade restrictiveness involves aggregating these different forms of trade barriers across goods with different economic importance. The World Bank's Tariff Trade Restrictiveness Index (TTRI) and Overall Trade Restrictiveness Index (OTRI) measure the impact of a country's trade policy on its imports. The TTRI is the estimated uniform tariff equivalent to the effectively applied tariffs currently imposed on various import products. The OTRI is the uniform tariff equivalent to current tariff and nontariff barriers to imports. A comparison of the TTRI and the OTRI implies that nontariff barriers are much higher than tariffs (figure 6i). On average, low-income economies impose higher tariffs and nontariff barriers than do other income groups to protect domestic production and raise revenue through taxes on imports. Although the average tariff and nontariff barriers imposed by high-income economies are low, their restrictions on agricultural products tend to be high. Because most of the world's poor earn their living through agriculture and other labor-intensive activities, substantial trade restrictions on these commodities block market access by the poor. Because high-income economies have the largest consumer markets, their trade policies have the most impact on developing economies' exports.

Exports from most economies face tariff and nontariff barriers in other economies. But low-income economies tend to face higher overall restrictions, especially for agricultural products (figure 6j). Market access by developing economies may also be affected by strict rules of origin that restrict preferential treatment of commodities not wholly produced in the exporting country.

As tariffs are the most widely known trade barrier, the MDG framework monitors the average tariffs imposed by OECD members on imports from developing economies. When examined in isolation, this indicator appears to show that developed economies have significantly lowered tariff barriers. But the actual situation is more complex. Averaging tariff rates

across thousands of products can mask high tariffs on certain commodities that are particularly important to developing economies. For some OECD members the maximum applied tariff rate can be as high as 887 percent (table 6k).

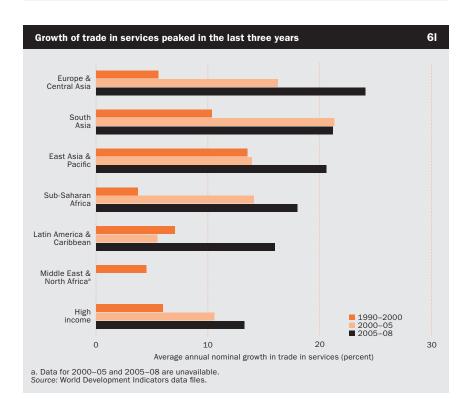

rooms entering Japan, steel entering the United

Among the most commonly used nontariff barriers are antidumping actions. Many highincome economies—and recently developing economies as well—initiate antidumping investigations. Whether for shiitake mush-

States, or shoes entering the European Union, antidumping initiations have a chilling effect on imports—even when they do not result in imposition of antidumping duties. Only about half of antidumping initiations are later imposed.

Trade in services has grown rapidly, but total value remains small

Growth in developing economies' trade in services averaged 21 percent a year between 2005 and 2008, surpassing their previous performances and those of high-income economies (figure 61). Europe and Central Asia experienced the highest growth, while Sub-Saharan Africa lagged behind. But trade in services still made up less than 20 percent of world trade in 2008.

The World Trade Organization recognizes four modes of trade in services: cross-border exchange of services (such as the purchase of services from a foreign supplier and outsourcing), consumption abroad (such as tourism, education, and health services), commercial presence of foreign companies in a country (involving foreign direct investments), and movement of people. Trade in services usually faces tighter regulation and higher barriers than trade in merchandise.

Large middle-income economies recently increased their market shares in the outsourcing of services. For example, China is a key product development center for General Electric, Intel, Microsoft, Philips, and other large electronic firms focused on hardware and software design. India is the largest offshore provider of information technology services, technical help desks, and web support. But few developing economies have benefited from the recent expansion of outsourcing. Poorer countries tend to lack the necessary infrastructure—such as robust telecommunication networks and a reliable power supply—and skilled and educated workers. Outsourcing companies also require strong legal systems that ensure data security and privacy, which many developing economies

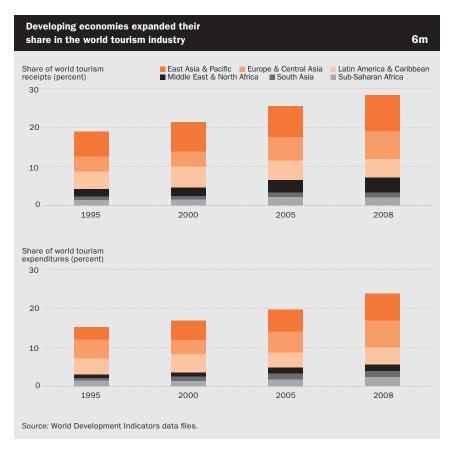

Tourism is one of the largest segments of trade in services, generating employment, providing valuable foreign currency exchange, and increasing government revenues through taxation. The tourism industry employs people with various skill sets, including cleaners, drivers, beauticians, managers, and chefs. Developing economies' receipts from tourism have increased considerably, from \$92 billion (19 percent of the world total) in 1995 to \$324 billion (28 percent) in 2008 (figure 6m). East Asia and Pacific and Europe and Central Asia are the biggest benefiters. Residents of developing economies are also increasing their spending on tourism to other countries.

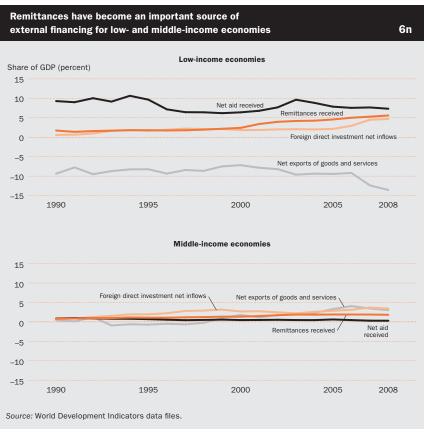

Human migration brings many benefits, such as remittances, improved skills and experience, and the transfer of technology during return migration. Workers' remittancesincluding employee compensation and migrant transfers—have become a large source of foreign exchange for many developing economies, increasing consumption and investment as well as the income of recipient families (figure 6n). For low-income economies with a negative trade balance, remittances provide an important source of external financing. Yet migration may have negative effects, siphoning off skilled workers and increasing inequality between remittance recipients and other families. Some economies have increased restrictions on labor services, including restrictions on the temporary cross-border movement of construction workers

Trade facilitation is improving slowly—but lower income economies lag behind

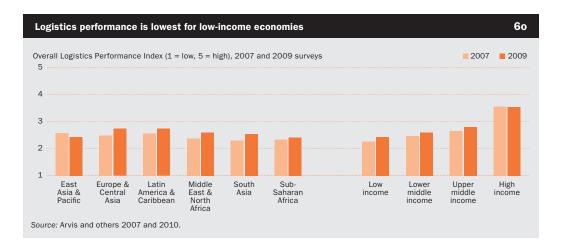

Trade facilitation may boost trade as effectively as tariff reduction (Hertel, Walmsley, and Itakura 2001; Wilson, Mann, and Otsuki 2004). The MDG framework recognizes the importance of trade facilitation by including an indicator to monitor aid for building trade capacity.

Aid for trade aims to help developing economies—especially low-income onesovercome structural and capacity limitations that undermine their ability to produce, compete, and fully benefit from global integration. One of many ways aid for trade can help developing economies is by identifying infrastructure bottlenecks, improving logistics efficiency, and smoothing the supply chain. But how should the impact of aid for trade on the performance of developing economies be measured? Outcome indicators such as value and growth of exports and imports are important; so are indicators that measure trade logistics performance and trade-related infrastructure. Better logistics performance is associated with trade expansion, export diversification, and the ability to attract foreign direct investment.

Until recently, data on trade facilitation and logistics performance have been scarce. But in 2007 and 2009 the World Bank surveyed logistics professionals and created a Logistics Performance Index that summarizes a country's performance in six areas of trade logistics: efficiency of customs clearance processes, quality of trade- and transport-related infrastructure, ease of arranging competitively priced shipments, competence and quality of logistics services, ability to track and trace consignments, and frequency with which shipments reach the consignee within the scheduled or expected time. The surveys suggest that transportation costs, the time to import and export, and customs efficiency are all key but that the most important determinant of export competitiveness and volume is the overall reliability and predictability of the supply chain (Arvis and others 2007, 2010). In essence, traders need to be able to move goods and services across borders quickly and cheaply. And in economies with poor logistics performance, importers and exporters incur additional expenses to mitigate the effects of unreliable supply chains.

High-income economies dominate the top ratings for logistics performance, while the 10 lowest performing economies are all low- and lower middle-income economies, mostly in Africa. Between 2006 and 2009 the overall logistics performance of economies improved, but low-income economies tend to perform worse than middle- and high-income economies (figure 60).

Higher transport costs impede trade in developing economies

The costs of international transport services are a crucial determinant of developing economies'

export competitiveness. For example, a 2001 study found that a 1 percent reduction in the cost of maritime and air transport services could increase Asian GDP by \$3.3 billion (UNCTAD 2001). Transport costs are asymmetric worldwide and are especially high for land-locked developing economies. In Central Asia the cost of transporting a 40 ton container by road between Central Asia and Europe varies depending on the direction traveled: moving goods west to east costs \$6,000 but moving them east to west costs only \$4,000 (Arvis, Raballand, and Marteau 2007).

Comprehensive data on transport costs for all developing economies are not available. One proxy indicator for transport costs is the shipping rates of companies that operate globally in the international freight moving business. For example, the median DHL rate for sending a 1 kilogram package to the United States was 1.6 times higher from low-income economies than from high-income economies.

Transport costs depend on a mixture of geographic and economic circumstances. Freight costs tend to be higher for low-income economies. Landlocked countries or countries without access to large economic centers face much higher transportation costs than do coastal countries and countries located near business centers (box 6p). These economies tend to have poor infrastructure and thin traffic densities, further impeding their export competitiveness.

Improving trade infrastructure to facilitate trade

Infrastructure, especially transport services infrastructure, is vital for trade facilitation. Port quality and accessibility, road quality,

and access to global shipping and air freight networks influence the overall logistics performance of international traders. For example, a 2006 study concluded that investment in upgrading and maintaining a trans-African highway network linking 83 major African cities could increase intra-African trade from \$10 billion a year to \$30 billion (Buys, Deichmann, and Wheeler 2006). Similarly, improving road networks in 27 European and Central Asian economies could increase their trade by as much as 50 percent (Shepherd and Wilson 2007).

Infrastructure quality may be just as important as its availability. According to a survey of logistics professionals, poor infrastructure quality is a widespread constraint on the logistics performance of developing economies. Moreover, satisfaction with infrastructure quality was much higher for economies ranked highest in overall logistics performance (Arvis and others 2010). Port infrastructure is important for economies that rely heavily on sea transport. According to a survey of business executives, 62 of 69 economies ranked below average in port quality were developing economies, 22 of them low-income (World Economic Forum 2009).

Time delays add to trading costs

Traders also face indirect transport costs: the time required to import and export goods, border inefficiency, and the risk of freight loss or damage. Indirect costs can be higher than direct costs. For example, World Bank research suggests that one additional day of shipping delays cuts trade by at least 1 percent (Djankov, Freund, and Pham 2010). In Europe and Central Asia and Sub-Saharan Africa tariff equivalents of time to export were more than twice the average applied tariff (USAID 2007). According to the 2009 Logistics Performance

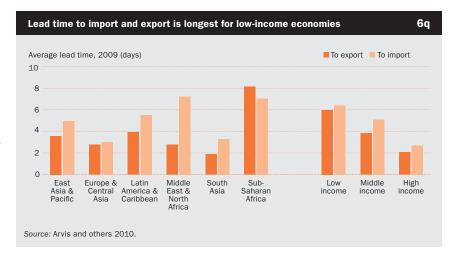

Challenges for landlocked economies

6n

Millennium Development Goal 8 focuses on landlocked countries. Like other small, low-income economies, landlocked developing economies have unpredictable supply chains, reflecting uncertainty in shipment delivery time, low demand levels, greater inventory costs, and low private sector capacities. Rent-seeking activities are higher when shipments transit through other economies and international corridors, contributing to higher trading costs (Arvis, Raballand, and Marteau 2007). On average, landlocked economies trade 30 percent less than coastal economies (Limao and Venables 2001).

Access to global shipping and freight networks is an important determinant of a country's export competitiveness. Because landlocked economies lack direct access to liner shipping networks, access to air cargo networks is especially important to them. Though faster and more reliable than road transport, air freight typically costs 4–5 times more than road transport and 12–16 times more than sea transport (World Bank 2009a). Consequently, demand for air freight is limited in landlocked developing economies that ship small volumes of low-value-per-unit goods. Establishing and improving the efficiency of international trade corridors could significantly benefit landlocked economies.

Source: World Bank staff.

Survey, for 50 percent of shipments, import and export lead times are three times longer for low-income economies than for high-income economies (figure 6q). And lead time to export from or import to Sub-Saharan African economies averages 7–8 days—much longer than for other developing regions such as Europe and Central Asia and South Asia.

a. Data are from the International Telecommunication Union's (ITU) World Telecommunication Development Report database. Please cite the ITU for third-party use of these data. b. World Bank estimates. c. Includes Taiwan, China. d. Includes Montenegro. e. World totals computed by the United Nations sum to zero, but because the aggregates shown here refer to World Bank definitions, regional and income group totals do not equal zero.

Integration with the global economy

6.1

About the data

Globalization—the integration of the world economy—has been a persistent theme of the past 25 years. Growth of cross-border economic activity has changed countries' economic structure and political and social organization. Not all effects of globalization can be measured directly. But the scope and pace of change can be monitored along four key dimensions: trade in goods and services, financial flows, movement of people, and communication.

Trade data are based on gross flows that capture the two-way flow of goods and services. In conventional balance of payments accounting, exports are recorded as a credit and imports as a debit. See tables 4.4 and 4.5 for data on the main trade components of merchandise trade and tables 4.6 and 4.7 for the same data on services trade.

Financing through international capital markets includes gross bond issuance, bank lending, and new equity placement as reported by Dealogic, a company specializing in the investment banking industry. In financial accounting inward investment is a credit and outward investment a debit. Gross flow is a better measure of integration than net flow because gross flow shows the total value of financial transactions over a period, while net flow is the sum of credits and debits and represents a balance in which many transactions are canceled out. Components of financing through international capital markets are reported in U.S. dollars by market sources

Foreign direct investment (FDI) includes equity investment, reinvested earnings, and short- and long-term loans between parent firms and foreign affiliates. Distinguished from other kinds of international

investment, FDI establishes a lasting interest in or effective management control over an enterprise in another country. FDI may be understated in developing countries because some fail to report reinvested earnings and because the definition of long-term loans differs by country. However, data quality and coverage are improving as a result of continuous efforts by international and national statistics agencies (see *About the data* for table 6.12).

Workers' remittances are current private transfers from migrant workers resident in the host country for more than a year, irrespective of their immigration status, to recipients in their country of origin. Compensation of employees is the income of migrants resident in the host country for less than a year. Migration has increased in importance, accounting for a substantial part of global integration. The estimates of the international migrant stock are derived from data on people who reside in one country but were born in another, mainly from population censuses (see About the data and Definitions for table 6.18). One negative effect of migration is "brain drain"—emigration of highly educated people. The table shows data on emigration of people with tertiary education, drawn from Docquier, Marfouk, and Lowell (2007), who analyzed skilled migration using data from censuses and registers of Organisation for Economic Development and Co-operation (OECD) countries and provide data disaggregated by gender for 1990 and 2000.

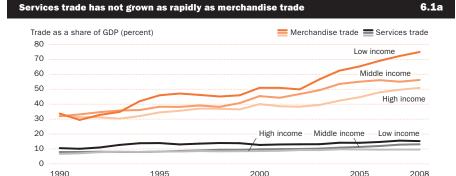

Well developed communications infrastructure attracts investments and allows investors to capitalize on benefits of the digital age. See *About the data* for tables 5.11 and 5.12 for more information.

Definitions

. Trade in merchandise is the sum of merchandise exports and imports. . Trade in services is the sum of services exports and imports. • Financing through international capital markets is the sum of the absolute values of new bond issuance, syndicated bank lending, and new equity placements. • Foreign direct investment net inflows and outflows are net inflows and outflows of FDI (equity capital, reinvestment of earnings, and other short- and long-term capital). • Workers' remittances and compensation of employees received are current transfers by migrant workers and wages and salaries of nonresident workers. • Net migration is the number of immigrants minus the number of emigrants, including citizens and noncitizens, for the five-year period. • International migrant stock is the number of people born in a country other than that in which they live, including refugees. • Emigration of people with tertiary education to OECD countries is adults ages 25 and older, residing in an OECD country other than that in which they were born, with at least one year of tertiary education. • International voice traffic is the sum of international incoming and outgoing telephone traffic divided by total population. • International Internet bandwidth is the contracted capacity of international connections between countries for transmitting Internet traffic.

Data sources

Data on merchandise trade are from the World Trade Organization's Annual Report. Data on trade in services are from the International Monetary Fund's (IMF) Balance of Payments database. Data on international capital market financing are based on data from Dealogic. Data on FDI are based on balance of payments data from the IMF, supplemented by staff estimates using data from the United Nations Conference on Trade and Development and official national sources. Data on workers' remittances are World Bank staff estimates based on IMF balance of payments data. Data on net migration are from the United Nations Population Division's World Population Prospects: The 2008 Revision. Data on international migrant stock are from the United Nations Population Division's Trends in Total Migrant Stock: The 2008 Revision. Data on emigration of people with tertiary education are from Docquier, Marfouk, and Lowell's "A Gendered Assessment of the Brain Drain" (2007). Data on international voice traffic and international Internet bandwidth are from the International Telecommunication Union's International Development Report database.

Merchandise trade in low-income economies grew from 34 percent of GDP in 1990 to 75 percent in 2008 and in middle-income economies from 32 percent to 56 percent. The shares of services trade in GDP also rose but not as much.

a. Data are from the International Monetary Fund's International Financial Statistics database.

About the data

Data on international trade in goods are available from each country's balance of payments and customs records. While the balance of payments focuses on the financial transactions that accompany trade, customs data record the direction of trade and the physical quantities and value of goods entering or leaving the customs area. Customs data may differ from data recorded in the balance of payments because of differences in valuation and time of recording. The 1993 United Nations System of National Accounts and the fifth edition of the International Monetary Fund's (IMF) Balance of Payments Manual (1993) attempted to reconcile definitions and reporting standards for international trade statistics, but differences in sources, timing, and national practices limit comparability. Real growth rates derived from trade volume indexes and terms of trade based on unit price indexes may therefore differ from those derived from national accounts aggregates.

Trade in goods, or merchandise trade, includes all goods that add to or subtract from an economy's material resources. Trade data are collected on the basis of a country's customs area, which in most cases is the same as its geographic area. Goods provided as part of foreign aid are included, but goods destined for extraterritorial agencies (such as embassies) are not.

Collecting and tabulating trade statistics are difficult. Some developing countries lack the capacity to report timely data, especially landlocked countries and countries whose territorial boundaries are porous. Their trade has to be estimated from the data reported by their partners. (For further discussion of the use of partner country reports, see About the data for table 6.3.) Countries that belong to common customs unions may need to collect data through direct inquiry of companies. Economic or political concerns may lead some national authorities to suppress or misrepresent data on certain trade flows. such as oil, military equipment, or the exports of a dominant producer. In other cases reported trade data may be distorted by deliberate under- or overinvoicing to affect capital transfers or avoid taxes. And in some regions smuggling and black market trading result in unreported trade flows.

By international agreement customs data are reported to the United Nations Statistics Division, which maintains the Commodity Trade (Comtrade) and Monthly Bulletin of Statistics databases. The United Nations Conference on Trade and Development (UNCTAD) compiles international trade statistics, including price, value, and volume indexes,

from national and international sources such as the IMF's International Financial Statistics database, the United Nations Economic Commission for Latin America and the Caribbean, the United Nations Statistics Division's Monthly Bulletin of Statistics database, the World Bank Africa Database, the U.S. Bureau of Labor Statistics, Japan Customs, and UNCTAD's Commodity Price Statistics. The IMF also compiles data on trade prices and volumes in its International Financial Statistics (IFS) database.

Unless otherwise noted, the growth rates and terms of trade in the table were calculated from index numbers compiled by UNCTAD. The growth rates and terms of trade for selected economies were calculated from index numbers compiled in the IMF's International Financial Statistics. In some cases price and volume indexes from different sources vary significantly as a result of differences in estimation procedures. Because the IMF does not publish trade value indexes, for selected economies the trade value indexes were derived from the volume and price indexes. All indexes are rescaled to a 2000 base year.

The terms of trade measures the relative prices of a country's exports and imports. There are several ways to calculate it. The most common is the net barter (or commodity) terms of trade index, or the ratio of the export price index to the import price index. When a country's net barter terms of trade index increases, its exports become more valuable or its imports cheaper.

Definitions

- Export and Import volumes are indexes of the quantity of goods traded. They are derived from UNCTAD's volume index series and are the ratio of the export or import value indexes to the corresponding unit value indexes. Unit value indexes are based on data reported by countries that demonstrate consistency under UNCTAD quality controls, supplemented by UNCTAD's estimates using the previous year's trade values at the Standard International Trade Classification three-digit level as weights. For economies for which UNCTAD does not publish data, the export and import volume indexes (lines 72 and 73) in the IMF's International Financial Statistics are used to calculate the average annual growth rates.
- Export and import values are the current value of exports (free on board, f.o.b.) or imports (cost, insurance, and freight, c.i.f.), converted to U.S. dollars and expressed as a percentage of the average for the base period (2000). UNCTAD's export or import value indexes are reported for most economies. For selected economies for which UNCTAD does not publish data, the value indexes are derived from export or import volume indexes (lines 72 and 73) and corresponding unit value indexes of exports or imports (lines 74 and 75) in the IMF's International Financial Statistics. Net barter terms of trade index is calculated as the percentage ratio of the export unit value indexes to the import unit value indexes, measured relative to the base year 2000.

Data sources

Data on trade indexes are from UNCTAD's annual Handbook of Statistics for most economies and from the IMF's International Financial Statistics for selected economies.

a. Data for 1998 are based on imports from South Africa reported by other economies because data on exports for South Africa were not available.

Direction and growth of merchandise trade

About the data

The table provides estimates of the flow of trade in goods between groups of economies. The data are from the International Monetary Fund's (IMF) Direction of Trade database. All high-income economies and major developing economies report trade on a timely basis, covering about 85 percent of trade for recent years. Trade by less timely reporters and by countries that do not report is estimated using reports of trading partner countries. Because the largest exporting and importing countries are reliable reporters, a large portion of the missing trade flows can be estimated from partner reports. Partner country data may introduce discrepancies due to smuggling, confidentiality, different exchange rates, overreporting of transit trade, inclusion or exclusion of freight rates, and different points of valuation and times of recording.

In addition, estimates of trade within the European Union (EU) have been significantly affected by changes in reporting methods following the creation of a customs union. The current system for collecting data on trade between EU members—Intrastat, introduced in 1993—has less exhaustive coverage than the previous customs-based system and has resulted in some problems of asymmetry (estimated imports are about 5 percent less than exports). Despite these issues, only a small portion of world trade is estimated to be omitted from the IMF's *Direction of Trade Statistics* Yearbook and Direction of Trade database.

Most countries report their trade data in national currencies, which are converted into U.S. dollars

using the IMF's published period average exchange rate (series rf or rh, monthly averages of the market or official rates) for the reporting country or, if unavailable, monthly average rates in New York. Because imports are reported at cost, insurance, and freight (c.i.f.) valuations, and exports at free on board (f.o.b.) valuations, the IMF adjusts country reports of import values by dividing them by 1.10 to estimate equivalent export values. The accuracy of this approximation depends on the set of partners and the items traded. Other factors affecting the accuracy of trade data include lags in reporting, recording differences across countries, and whether the country reports trade according to the general or special system of trade. (For further discussion of the measurement of exports and imports, see About the data for tables

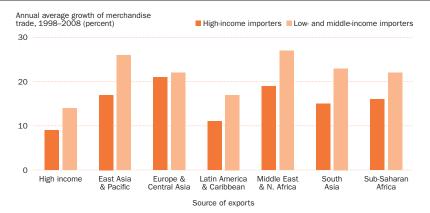

The regional trade flows in the table are calculated from current price values. The growth rates are in nominal terms; that is, they include the effects of changes in both volumes and prices.

Definitions

· Merchandise trade includes all trade in goods; trade in services is excluded. • High-income economies are those classified as such by the World Bank (see inside front cover). • European Union is defined as all high-income EU members: Austria, Belgium, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Ireland, Italy, Luxembourg, Malta, the Netherlands, Portugal, Slovak Republic, Slovenia, Spain, Sweden, and the United Kingdom. • Other high-income economies include all high-income economies (both Organisation for Economic Co-operation and Development members and others) except the high-income European Union, Japan, and the United States. • Low- and middleincome regional groupings are based on World Bank classifications (see inside back cover for regional groupings) and may differ from those used by other organizations.

6.3a

Low- and middle-income economies increased their imports from other low- and middle-income economies. High-income economies are also increasingly importing from low- and middle-income economies.

Source: World Bank staff calculations based on data from the International Monetary Fund's Direction of Trade database.

Data sources

Data on the direction and growth of merchandise trade were calculated using the IMF's Direction of Trade database.

About the data

Developing economies are becoming increasingly important in the global trading system. Since the early 1990s trade between high-income economies and low- and middle-income economies has grown faster than trade among high-income economies. The increased trade benefits consumers and producers. But as was apparent at the World Trade Organization's (WTO) Ministerial Conferences in Doha, Qatar, in October 2001; Cancun, Mexico, in September 2003; and Hong Kong SAR, China, in December 2005, achieving a more pro-development outcome from trade remains a challenge. Doing so will require strengthening international consultation. After the Doha meetings negotiations were launched on services, agriculture, manufactures, WTO rules, the environment, dispute settlement, intellectual property rights protection, and disciplines on regional integration. At the most recent negotiations in Hong Kong SAR, China, trade ministers agreed to eliminate subsidies of agricultural exports by 2013; to abolish cotton export subsidies and grant unlimited export access to selected cotton-growing countries in Sub-Saharan Africa; to cut more domestic farm supports in the European Union, Japan, and the United States; and to offer more aid to developing countries to help them compete in global trade.

Trade flows between high-income and low- and middle-income economies reflect the changing mix of exports to and imports from developing economies. While food and primary commodities have continued to fall as a share of high-income economies' imports,

manufactures as a share of goods imports from both low- and middle-income economies have grown. And trade between developing economies has grown substantially over the past decade, a result of their increasing share of world output and liberalization of trade, among other influences.

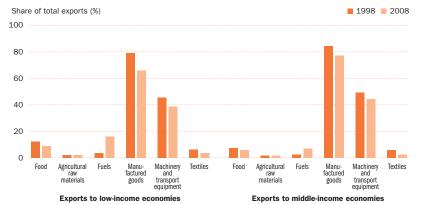

Yet trade barriers remain high. The table includes information about tariff rates by selected product groups. Applied tariff rates are the tariffs in effect for partners in preferential trade agreements such as the North American Free Trade Agreement. When these rates are unavailable, most favored nation rates are used. The difference between most favored nation and applied rates can be substantial. Simple averages of applied rates are shown because they are generally a better indicator of tariff protection than weighted average rates are.

The data are from the United Nations Conference on Trade and Development (UNCTAD). Partner country reports by high-income economies were used for both exports and imports. Because of differences in sources of data, timing, and treatment of missing data, the numbers in the table may not be fully comparable with those used to calculate the direction of trade statistics in table 6.3 or the aggregate flows in tables 4.4, 4.5, and 6.2. Tariff line data were matched to Standard International Trade Classification (SITC) revision 3 codes to define commodity groups. For further discussion of merchandise trade statistics, see *About the data* for tables 4.4, 4.5, 6.2, 6.3, and 6.5, and for information about tariff barriers, see table 6.8.

Definitions

The product groups in the table are defined in accordance with SITC revision 3: food (0, 1, 22, and 4) and cereals (04); agricultural raw materials (2 excluding 22, 27, and 28); ores and nonferrous metals (27, 28, and 68); fuels (3), crude petroleum (crude petroleum oils and oils obtained from bituminous minerals; 333), and petroleum products (noncrude petroleum and preparations; 334); manufactured goods (5-8 excluding 68), chemical products (5), iron and steel (67), machinery and transport equipment (7), furniture (82), textiles (65 and 84), footwear (85), and other manufactured goods (6 and 8 excluding 65, 67, 68, 82, 84, and 85); and miscellaneous goods (9). • Exports are all merchandise exports by high-income economies to low-income and middle-income economies as recorded in the United Nations Statistics Division's Comtrade database. Exports are recorded free on board (f.o.b.). • Imports are all merchandise imports by highincome economies from low-income and middleincome economies as recorded in the United Nations Statistics Division's Commodity Trade (Comtrade) database. Imports include insurance and freight charges (c.i.f.). • High-, middle-, and low-income economies are those classified as such by the World Bank (see inside front cover). • European Union is defined as all high-income EU members: Austria, Belgium, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Ireland, Italy, Luxembourg, Malta, the Netherlands, Portugal, Slovak Republic, Slovenia, Spain, Sweden, and the United Kingdom.

Some 65–75 percent of high-income economy exports to low-income and middle-income economies in 2008 were manufactured goods. Machinery and equipment accounted for nearly 60 percent of manufactured goods exports from high-income economies.

Source: World Bank staff calculations based on data from the United Nations Statistics Division's Comtrade database.

Data sources

Data on trade values are from United Nations Statistics Division's Comtrade database. Data on tariffs are from UNCTAD's Trade Analysis and Information System database and are calculated by World Bank staff using the World Integrated Trade Solution system.

6.5

Direction of trade of developing economies

About the data

Developing economies are an increasingly important part of the global trading system. Their share of world merchandise exports rose from 15 percent in 1990 to 31 percent in 2008. And trade between high-income economies and low- and middle-income economies has grown faster than trade between high-income economies. This increased trade benefits both producers and consumers in developing and high-income economies.

The table shows trade in goods between developing economies in the same region and other regions and between developing economies and high-income economies. Data on exports and imports are from the International Monetary Fund's (IMF) Direction of Trade database and should be broadly consistent with data from other sources, such as the United Nations Statistics Division's Commodity Trade (Comtrade) database. Generally, data on trade between developing and high-income economies are complete. But trade flows between many developing economies—particularly those in Sub-Saharan Africa—are not well recorded, and the value of trade among developing economies may be understated. The table does not include some developing economies because data on their bilateral trade flows are not available. Data on the direction of trade between selected high-income economies are presented and discussed in tables 6.3 and 6.4.

At the regional level most exports from developing economies are to high-income economies, but the share of intraregional trade is increasing. Geographic patterns of trade vary widely by country and commodity. Larger shares of exports from oiland resource-rich economies are to high-income economies.

The relative importance of intraregional trade is higher for both landlocked countries and small countries with close trade links to the largest regional economy. For most developing economiesespecially smaller ones—there is a "geographic bias" favoring intraregional trade. Despite the broad trend toward globalization and the reduction of trade barriers, the relative share of intraregional trade increased for most economies between 1998 and 2008. This is due partly to trade-related advantages, such as proximity, lower transport costs, increased knowledge from repeated interaction, and cultural and historical affinity. The direction of trade is also influenced by preferential trade agreements that a country has made with other economies. Though formal agreements on trade liberalization do not automatically increase trade, they nevertheless affect the direction of trade between the participating economies. Table 6.7 illustrates the size of existing regional trade blocs that have formal preferential

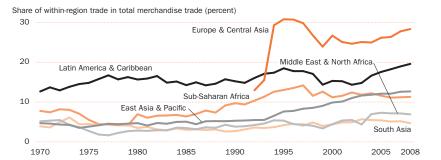

Although global integration has increased, developing economies still face trade barriers when accessing other markets (see table 6.8).

Definitions

· Exports to developing economies within region are the sum of merchandise exports from the reporting economy to other developing economies in the same World Bank region as a percentage of total merchandise exports by the economy. • Exports to developing economies outside region are the sum of merchandise exports from the reporting economy to other developing economies in other World Bank regions as a percentage of total merchandise exports by the economy. • Exports to high-income economies are the sum of merchandise exports from the reporting economy to high-income economies as a percentage of total merchandise exports by the economy. • Imports from developing economies within region are the sum of merchandise imports by the reporting economy from other developing economies in the same World Bank region as a percentage of total merchandise imports by the economy. • Imports from developing economies outside region are the sum of merchandise imports by the reporting economy from other developing economies in other World Bank regions as a percentage of total merchandise imports by the economy. • Imports from high-income economies are the sum of merchandise imports by the reporting economy from high-income economies as a percentage of total merchandise imports by the

Developing economies are increasingly trading with other developing economies in the same region

6 5a

Within-region trade (merchandise exports plus merchandise imports) has increased in all regions. In 2008 nearly 30 percent of merchandise trade in Europe and Central Asia and 20 percent in East Asia and Pacific was with other economies in the region.

Source: World Bank staff calculations based on data from International Monetary Fund's Direction of Trade database.

Data sources

Data on merchandise trade flows are published in the IMF's Direction of Trade Statistics Yearbook and Direction of Trade Statistics Quarterly; the data in the table were calculated using the IMF's Direction of Trade database. Regional and income group classifications are according to the World Bank classification of economies as of July 1, 2009, and are as shown on the cover flaps.

Note: bbl = barrel, cu. m = cubic meter, dmtu = dry metric ton unit, kg = kilogram, mmBtu = million British thermal units, mt = metric ton, toz = troy ounce. a. Series not included in the nonenergy index.

Primary commodities—raw or partially processed materials that will be transformed into finished goods—are often developing countries' most important exports, and commodity revenues can affect living standards. Price data are collected from various sources, including international commodity study groups, government agencies, industry trade journals, and Bloomberg and Datastream. Prices are compiled in U.S. dollars or converted to U.S. dollars when quoted in local currencies.

The table is based on frequently updated price reports. Prices are those received by exporters when available, or the prices paid by importers or trade unit values. Annual price series are generally simple averages based on higher frequency data. The constant price series in the table are deflated by the manufactures unit value (MUV) index for the Group of Five (G-5) countries (see below).

Commodity price indexes are calculated as Laspeyres index numbers; the fixed weights are the 2002–04 average export values for low- and middle-income economies (based on 2001 gross national income) rebased to 2000. Data for exports are from the United Nations Statistics Division's Commodity Trade Statistics (Comtrade) database Standard International Trade Classification (SITC) revision 3, the Food Agriculture Organization's FAOSTAT database, the International Energy Agency database, BP's Statistical Review of World Energy, the World Bureau of Metal Statistics, World Bank staff estimates, and other sources.

Each index in the table represents a fixed basket of primary commodity exports over time. The nonenergy

commodity price index contains 41 price series for 34 nonenergy commodities.

Separate indexes are compiled for energy and steel products, which are not included in the nonenergy commodity price index.

The MUV index is a composite index of prices for manufactured exports from the five major (G-5) industrial economies (France, Germany, Japan, the United Kingdom, and the United States) to low- and middle-income economies, valued in U.S. dollars. The index covers products in groups 5–8 of SITC revision 1. For the MUV G-5 index, unit value indexes in local currency for each country are converted to U.S. dollars using market exchange rates and are combined using weights determined by each country's export share in the base year (1995). The export shares were 8.2 percent for France, 17.4 percent for Germany, 35.6 percent for Japan, 6.6 percent for the United Kingdom, and 32.2 percent for the United States.

Definitions

. Energy price index is the composite price index for coal, petroleum, and natural gas, weighted by exports of each commodity from low- and middle-income countries. • Nonenergy commodity price index covers the 34 nonenergy primary commodities that make up the agriculture, fertilizer, and metals and minerals indexes. • Agriculture includes beverages, food, and agricultural raw materials. • Beverages include cocoa, coffee, and tea. . Food includes fats and oils, grains, and other food items. Fats and oils include coconut oil, groundnut oil, palm oil, soybeans, soybean oil, and soybean meal. Grains include barley, maize, rice, and wheat. Other food items include bananas, beef, chicken meat, oranges, shrimp, and sugar. • Agricultural raw materials include timber and other raw materials. Timber includes tropical hard logs and sawnwood. Other raw materials include cotton, natural rubber, and tobacco. • Fertilizers include phosphate, phosphate rock, potassium, and nitrogenous products. . Metals and minerals include aluminum, copper, iron ore, lead, nickel, tin, and zinc. • Steel products price index is the composite price index for eight steel products based on quotations free on board (f.o.b.) Japan excluding shipments to the United States for all years and to China prior to 2001, weighted by product shares of apparent combined consumption (volume of deliveries) for Germany, Japan, and the United States. . Commodity prices—for definitions and sources, see "Commodity price data" (also known as the "Pink Sheet") at the World Bank Prospects for Development website (www.worldbank.org/prospects, click on Products).

Commodity prices rose rapidly in early 2008 before collapsing in the second half of the year. But prices rose again in 2009. Between January 2009 and January 2010 the average price of energy commodities increased 57 percent and the average price of nonenergy commodities increased 30 percent.

a. CU is customs union; EIA is economic integration agreement; FTA is free trade agreement; PTA is preferential trade agreement; and NNA is not notified agreement, which refers to preferential trade arrangements established among member countries that are not notified to the World Trade Organization (these agreements may be functionally equivalent to any of the other agreements). b. No preferential trade agreement c. Years of the most recent agreement are collected from the official website of the trade bloc.

Regional trade blocs

6.7

About the data

Trade blocs are groups of countries with preferential arrangements governing trade between members. Although the preferences—such as lower tariff duties or exemptions from quantitative restrictions—may be no greater than those available to other trading partners, such arrangements are intended to encourage exports by bloc members to one another—sometimes called intratrade.

Most countries are members of a regional trade bloc, and more than a third of world trade takes place within such arrangements. While trade blocs vary in structure, they have the same objective: to reduce trade barriers between members. But effective integration requires more than reducing tariffs and quotas. Economic gains from competition and scale may not be achieved unless other barriers that divide markets and impede the free flow of goods, services, and investments are lifted. For example, many regional trade blocs retain contingent protections on intratrade, including antidumping, countervailing duties, and "emergency protection" to address balance of payments problems or protect an industry from import surges. Other barriers include differing product standards, discrimination in public procurement, and cumbersome border formalities.

Trade bloc membership may reduce the frictional costs of trade, increase the credibility of reform initiatives, and strengthen security among partners. But making it work effectively is challenging. All economic sectors may be affected, and some may expand while others contract, so it is important to weigh the potential costs and benefits of membership.

The table shows the value of merchandise intratrade (service exports are excluded) for important regional trade blocs and the size of intratrade relative to each bloo's exports of goods and the share of the bloc's exports in world exports. Although the Asia Pacific Economic Cooperation (APEC) has no preferential arrangements, it is included because of the volume of trade between its members.

The data on country exports are from the International Monetary Fund's (IMF) Direction of Trade database and should be broadly consistent with those from sources such as the United Nations Statistics Division's Commodity Trade (Comtrade) database. However, trade flows between many developing countries, particularly in Sub-Saharan Africa, are not well recorded, so the value of intratrade for certain groups may be understated. Data on trade between developing and high-income countries are generally complete.

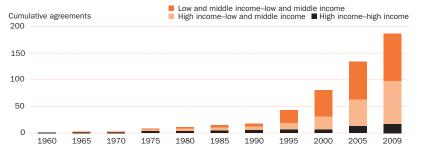

Unless otherwise noted, the type of agreement and date of enforcement are based on the World Trade Organization's (WTO) list of regional trade agreements. Other types of preferential trade agreements may have entered into force earlier than those shown in the table and may still be effective.

Although bloc exports have been calculated back to 1990 based on current membership, several blocs came into existence after that and membership may have changed over time. For this reason, and because systems of preferences also change over time, intratrade in earlier years may not have been affected by the same preferences as in recent years. In addition, some countries belong to more than one trade bloc, so shares of world exports exceed 100 percent. Exports include all commodity trade, which may include items not specified in trade bloc agreements. Differences from previously published estimates may be due to changes in membership or revisions in underlying data.

Definitions

. Merchandise exports within bloc are the sum of merchandise exports by members of a trade bloc to other members of the bloc. They are shown both in U.S. dollars and as a percentage of total merchandise exports by the bloc. • Merchandise exports by bloc as a share of world exports are the bloc's total merchandise exports (within the bloc and to the rest of the world) as a share of total merchandise exports by all economies in the world. • Type of most recent agreement includes customs union, under which members substantially eliminate all tariff and nontariff barriers among themselves and establish a common external tariff for nonmembers; economic integration agreement, which liberalizes trade in services among members and covers a substantial number of sectors, affects a sufficient volume of trade, includes substantial modes of supply, and is nondiscriminatory (in the sense that similarly situated service suppliers are treated the same); free trade agreement, under which members substantially eliminate all tariff and nontariff barriers but set tariffs on imports from nonmembers; preferential trade agreement, which is an agreement notified to the WTO that is not a free trade agreement, a customs union, or an economic integration agreement; and not notified agreement, which is a preferential trade arrangement established among member countries that is not notified to the World Trade Organization (the agreement may be functionally equivalent to any of the other agreements).

Note: Data are cumulative number of trade agreements notified to the General Agreement on Tariffs and Trade/World Trade Organization (GATT/WTO) at the time they entered into force. Includes only agreements that are currently in force. Excludes agreements on services and accessions of new members to an existing agreement.

Source: World Bank staff calculations based on the World Trade Organization's Regional Trade Agreements Information System.

Data sources

Data on merchandise trade flows are published in the IMF's *Direction of Trade Statistics Yearbook* and *Direction of Trade Statistics Quarterly;* the data in the table were calculated using the IMF's Direction of Trade database. Data on trade bloc membership are from the World Bank Policy Research Report *Trade Blocs* (2000b), UNCTAD's *Trade and Development Report 2007*, WTO's Regional Trade Agreements Information System, and the World Bank's International Trade Unit.

a. Includes Montenegro.

About the data

Poor people in developing countries work primarily in agriculture and labor-intensive manufactures, sectors that confront the greatest trade barriers. Removing barriers to merchandise trade could increase growth in these countries—even more if trade in services (retailing, business, financial, and telecommunications services) were also liberalized.

In general, tariffs in high-income countries on imports from developing countries, though low, are twice those collected from other high-income countries. But protection is also an issue for developing countries, which maintain high tariffs on agricultural commodities, labor-intensive manufactures, and other products and services. In some developing country regions new trade policies could make the difference between achieving important Millennium Development Goals—reducing poverty, lowering maternal and child mortality rates, improving educational attainment—and falling far short.

Countries use a combination of tariff and nontariff measures to regulate imports. The most common form of tariff is an ad valorem duty, based on the value of the import, but tariffs may also be levied on a specific, or per unit, basis or may combine ad valorem and specific rates. Tariffs may be used to raise fiscal revenues or to protect domestic industries from foreign competition—or both. Nontariff barriers, which limit the quantity of imports of a particular good, include quotas, prohibitions, licensing schemes, export restraint arrangements, and health and quarantine measures. Because of the difficulty of combining nontariff barriers into an aggregate indicator, they are not included in the table.

Unless specified as most favored nation rates, the tariff rates used in calculating the indicators in the table are effectively applied rates. Effectively applied rates are those in effect for partners in preferential trade arrangements such as the North American Free Trade Agreement. The difference between most favored nation and applied rates can be substantial. As more countries report their free trade agreements, suspensions of tariffs, or other special preferences, World Development Indicators will include their effectively applied rates. All estimates are calculated using the most recent information, which is not necessarily revised every year. As a result, data for the same year may differ from data in last year's edition.

Three measures of average tariffs are shown: simple bound rates and the simple and the weighted tariffs. Bound rates are based on all products in a country's tariff schedule, while the most favored nation or applied rates are calculated using all traded items. Weighted mean tariffs are weighted by the value of the country's trade with each trading partner. Simple averages are often a better indicator of tariff protection than weighted averages, which are biased downward because higher tariffs discourage trade and reduce the weights applied to these tariffs. Bound rates result from trade negotiations incorporated into a country's schedule of concessions and are thus enforceable.

Some countries set fairly uniform tariff rates across all imports. Others are selective, setting high tariffs to protect favored domestic industries. The share of tariff lines with international peaks provides an indication of how selectively tariffs are applied. The effective rate of protection—the degree to which the value added in an industry is protected—may exceed the nominal rate if the tariff system systematically differentiates among imports of raw materials, intermediate products, and finished goods.

The share of tariff lines with specific rates shows the extent to which countries use tariffs based on physical quantities or other, non-ad valorem measures. Some countries such as Switzerland apply mainly specific duties. To the extent possible, these specific rates have been converted to their ad valorem equivalent rates and have been included in the calculation of simple and weighted tariffs.

Data are classified using the Harmonized System of trade at the six- or eight-digit level. Tariff line data were matched to Standard International Trade Classification (SITC) revision 3 codes to define commodity groups and import weights. Import weights were calculated using the United Nations Statistics Division's Commodity Trade (Comtrade) database. The table shows tariff rates for three commodity groups: all products, primary products, and manufactured products. Effectively applied tariff rates at the six- and eight-digit product level are averaged for products in each commodity group. When the effectively applied rate is unavailable, the most favored nation rate is used instead.

Data are shown only for the last year for which complete data are available and for all economies with populations of 1 million or more and for countries with populations of less than 1 million when available. EU member countries apply a common tariff schedule that is listed under European Union and are thus not listed separately.

Definitions

. Binding coverage is the percentage of product lines with an agreed bound rate. • Simple mean **bound rate** is the unweighted average of all the lines in the tariff schedule in which bound rates have been set. • Simple mean tariff is the unweighted average of effectively applied rates or most favored nation rates for all products subject to tariffs calculated for all traded goods. • Weighted mean tariff is the average of effectively applied rates or most favored nation rates weighted by the product import shares corresponding to each partner country. • Share of tariff lines with international peaks is the share of lines in the tariff schedule with tariff rates that exceed 15 percent. • Share of tariff lines with specific rates is the share of lines in the tariff schedule that are set on a per unit basis or that combine ad valorem and per unit rates. • Primary products are commodities classified in SITC revision 3 sections 0-4 plus division 68 (nonferrous metals). • Manufactured products are commodities classified in SITC revision 3 sections 5-8 excluding division 68.

Data sources

All indicators in the table were calculated by World Bank staff using the World Integrated Trade Solution system. Data on tariffs were provided by the United Nations Conference on Trade and Development and the World Trade Organization. Data on global imports are from the United Nations Statistics Division's Comtrade database.

a. Average of the 2008 and 2009 survey ratings. b. Landlocked country. c. Includes Montenegro. d. Aggregates are computed according to the World Bank classification of economies as of July 1, 2009, and may differ from data published in the original source.

About the data

Broadly defined, trade facilitation encompasses customs efficiency and other physical and regulatory environments where trade takes place, harmonization of standards and conformance to international regulations, and the logistics of moving goods and associated documentation through countries and ports. Though collection of trade facilitation data has improved over the last decade, data that allow meaningful evaluation, especially for developing economies, are lacking. Data on trade facilitation are drawn from research by private and international agencies. Most data are perception-based evaluations by business executives and professionals. Because of different backgrounds, values, and personalities, those surveyed may evaluate the same situation quite differently. Perception-based indicators are thus subject to bias and require caution when interpreting the results. Nevertheless, they convey much needed information on trade facilitation.

The table presents data from Logistics Performance Surveys conducted by the World Bank in partnership with academic and international institutions and private companies and individuals engaged in international logistics. The Logistics Performance Index assesses logistics performance across six aspects of the logistics environment (see Definitions), based on more than 5,000 country assessments by nearly 1,000 international freight forwarders. Respondents evaluate eight markets on six core dimensions on a scale from 1 (worst) to 5 (best). The markets are chosen based on the most important export and import markets of the respondent's country, random selection, and, for landlocked countries, neighboring countries that connect them with international markets. Scores for the six areas are averaged across all respondents and aggregated to a single score. Details of the survey methodology and index construction methodology are in Arvis and others (2010)

Data on the burden of customs procedures are from the World Economic Forum's Executive Opinion Survey. The 2009 round included more than 13,000 respondents from 133 countries. Sampling follows a dual stratification based on company size and the sector of activity. Data are collected online or through in-person interviews. Responses are aggregated using sector-weighted averaging. The data for the latest year are combined with the data for the previous year to create a two-year moving average. Respondents evaluated the efficiency of customs procedures in their country. The lowest value (1) rates the customs procedure as extremely inefficient, and the highest score (7) as extremely efficient.

The direct costs of cross-border trade include freight, customs, and storage fees. Indirect costs include the value of time to import or export and the risk of delay or loss of shipments. Long lead times and burdensome regulatory procedures may lower competitiveness. Data on lead time are from the LPI survey. Respondents provided separate values for the best case (10 percent of shipments) and the median case (50 percent of shipments). The data are exponentiated averages of the logarithm of single value responses and of midpoint values of range responses for the median case.

Data on the number of documents needed to export or import are from the World Bank's Doing Business surveys, which compile procedural requirements for exporting and importing a standardized cargo of goods by ocean transport from local freight forwarders, shipping lines, customs brokers, port officials, and banks. To make the data comparable across economies, several assumptions about the business and the traded goods are used (see www.doingbusiness.org).

Access to global shipping and air freight networks and the quality and accessibility of ports and roads affect logistics performance. The table shows two indicators related to trade and transport service infrastructure: the Liner Shipping Connectivity Index and the quality of port infrastructure rating. The Liner Shipping Connectivity Index captures how well countries are connected to global shipping networks. It is computed by the United Nations Conference on Trade and Development (UNCTAD) based on five components of the maritime transport sector: number of ships, their container-carrying capacity, maximum vessel size, number of services, and number of companies that deploy container ships in a country's ports. For each component a country's value is divided by the maximum value of each component in 2004, the five components are averaged for each country, and the average is divided by the maximum average for 2004 and multiplied by 100. The index generates a value of 100 for the country with the highest average index in 2004.

The quality of port infrastructure measures business executives' perception of their country's port facilities. Values range from 1 (port infrastructure considered extremely underdeveloped) to 7 (port infrastructure considered efficient by international standards). Respondents in landlocked countries were asked: "How accessible are port facilities (1 = extremely inaccessible; 7 = extremely accessible.)"

The costs of transport services are a crucial determinant of export competitiveness. The proxy indicator in the table is the shipping rates to the United States of an international freight moving business.

Definitions

 Logistics Performance Index reflects perceptions of a country's logistics based on efficiency of customs clearance process, quality of trade- and transportrelated infrastructure, ease of arranging competitively priced shipments, quality of logistics services, ability to track and trace consignments, and frequency with which shipments reach the consignee within the scheduled time. The index ranges from 1 to 5, with a higher score representing better performance. Burden of customs procedure measures business executives' perceptions of their country's efficiency of customs procedures. Values range from 1 to 7, with a higher rating indicating greater efficiency. • Lead time to export is the median time (the value for 50 percent of shipments) from shipment point to port of loading. • Lead time to import is the median time (the value for 50 percent of shipments) from port of discharge to arrival at the consignee. • Documents to export and documents to import are all documents required per shipment by government ministries, customs authorities, port and container terminals, health and technical control agencies, and banks to export or import goods. Documents renewed annually and not requiring renewal per shipment are excluded. • Liner Shipping Connectivity Index indicates how well countries are connected to global shipping networks based on the status of their maritime transport sector. The highest value in 2004 is 100. • Quality of port infrastructure measures business executives' perceptions of their country's port facilities. Values range from 1 to 7, with a higher rating indicating better development of port infrastructure. • Freight costs to the United States is the DHL international U.S. inbound worldwide priority express rate for a 1 kilogram air package. Any

surcharges are excluded.

Data on the Logistics Performance Index and lead time to export and import are from Arvis and others' Connecting to Compete: Trade Logistics in the Global Economy 2010. Data on the burden of customs procedure and quality of port infrastructure ratings are from the World Economic Forum's Global Competitiveness Report 2009-2010. Data on number of documents to export and import are from the World Bank's Doing Business project (www.doingbusiness.org). Data on the Liner Shipping Connectivity Index are from UNCTAD's Transport Newsletter, No. 43 (2009). Freight costs to the United States are based on DHL's "DHL Express Standard Rate Guideline 2010" (2010).

a. Includes Montenegro. b. Data are likely to be revised after being reconciled with creditor data. Total external debt for 2008 was \$5.199 billion, according to debtor reports published in Global Development Finance.

About the data

External indebtedness affects a country's creditworthiness and investor perceptions. Data on external debt are gathered through the World Bank's Debtor Reporting System. Indebtedness is calculated using loan-by-loan reports submitted by countries on long-term public and publicly guaranteed borrowing and information on short-term debt collected by the countries or from creditors through the reporting systems of the Bank for International Settlements. These data are supplemented by information from major multilateral banks and official lending agencies in major creditor countries and by estimates by World Bank and International Monetary Fund (IMF) staff. The table includes data on long-term private nonguaranteed debt reported to the World Bank or estimated by its staff.

Data coverage, quality, and timeliness vary by country. Coverage varies for debt instruments and borrowers. The widening spectrum of debt instruments and investors alongside the expansion of private nonguaranteed borrowing makes comprehensive coverage of external debt more complex. Reporting countries differ in their capacity to monitor debt, especially private nonguaranteed debt. Even data on public and publicly guaranteed debt are affected by coverage and reporting accuracy—because of monitoring capacity and sometimes because of unwillingness to provide information. A key part often underreported is military debt. Currently, 128 developing countries report to the Debtor Reporting System. Nonreporting countries might have outstanding debt with the World Bank, other international financial institutions, and private creditors.

Debt data, normally reported in the currency of repayment, are converted into U.S. dollars to produce summary tables. Stock figures (amount of debt outstanding) are converted using end-of-period exchange rates, as published in the IMF's *International Financial Statistics* (line ae). Flow figures are converted at annual average exchange rates (line rf). Projected debt service is converted using end-of-period exchange rates. Debt repayable in multiple currencies, goods, or services and debt with a provision for maintenance of the value of the currency of repayment are shown at book value.

Because flow data are converted at annual average exchange rates and stock data at end-of-period exchange rates, year-to-year changes in debt outstanding and disbursed are sometimes not equal to net flows (disbursements less principal repayments); similarly, changes in debt outstanding, including undisbursed debt, differ from commitments less repayments. Discrepancies are particularly notable when exchange rates have moved sharply during the year. Cancellations and reschedulings of other liabilities into long-term public debt also contribute to the differences.

Variations in reporting rescheduled debt also affect cross-country comparability. For example, rescheduling of official Paris Club creditors may be subject to lags between completion of the general rescheduling agreement and completion of the specific bilateral agreements that define the terms of the rescheduled debt. Other areas of inconsistency include country treatment of arrears and of nonresident national deposits denominated in foreign currency.

Definitions

 Total external debt is debt owed to nonresidents repayable in foreign currency, goods, or services. It is the sum of public, publicly guaranteed, and private nonguaranteed long-term debt, short-term debt, and use of IMF credit. • Long-term debt is debt that has an original or extended maturity of more than one year. It has three components: public, publicly guaranteed, and private nonguaranteed debt. • Public and publicly guaranteed debt comprises the longterm external obligations of public debtors, including the national government and political subdivisions (or an agency of either) and autonomous public bodies, and the external obligations of private debtors that are guaranteed for repayment by a public entity. · IBRD loans and IDA credits are extended by the World Bank. The International Bank for Reconstruction and Development (IBRD) lends at market rates. The International Development Association (IDA) provides credits at concessional rates. • Private nonguaranteed debt consists of the long-term external obligations of private debtors that are not guaranteed for repayment by a public entity. • Short-term debt is debt owed to nonresidents having an original maturity of one year or less and interest in arrears on longterm debt. • Use of IMF credit denotes members' drawings on the IMF other than those drawn against

the country's reserve tranche position and includes

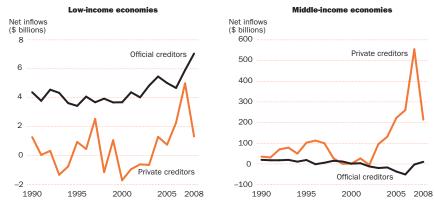

purchases and drawings under Stand-By, Extended,

Structural Adjustment, Enhanced Structural Adjustment, and Systemic Transformation Facility Arrange-

ments, together with Trust Fund loans.

Debt flows from private creditors to low- and middle-income economies fell sharply in 2008

6.10a

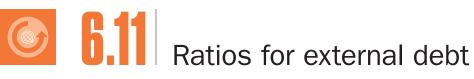

In 2008 debt flows from private creditors to low- and middle-income economies fell 61 percent, a decline only partially offset by an increase in net flows from official creditors.

Source: Global Development Finance data files.

Data sources

Data on external debt are mainly from reports to the World Bank through its Debtor Reporting System from member countries that have received IBRD loans or IDA credits, with additional information from the files of the World Bank, the IMF, the African Development Bank and African Development Fund, the Asian Development Bank and Asian Development Fund, and the Inter-American Development Bank. Summary tables of the external debt of developing countries are published annually in the World Bank's Global Development Finance, on its Global Development Finance CD-ROM, and on GDF Online.

a. Includes workers' remittances. b. The numerator refers to 2008, whereas the denominator is a three year average of 2006–08 data. c. Data are from debt sustainability analyses for low-income countries. Present value estimates for these countries are for public and publicly guaranteed debt only. d. Includes Montenegro.

Ratios for external debt

About the data

A country's external debt burden, both debt outstanding and debt service, affects its creditworthiness and vulnerability. The table shows total external debt relative to a country's size—gross national income (GNI). Total debt service is contrasted with countries' ability to obtain foreign exchange through exports of goods, services, income, and workers' remittances.

Multilateral debt service (shown as a share of the country's total public and publicly guaranteed debt service) are obligations to international financial institutions, such as the World Bank, the International Monetary Fund (IMF), and regional development banks. Multilateral debt service takes priority over private and bilateral debt service, and borrowers must stay current with multilateral debts to remain creditworthy. While bilateral and private creditors often write off debts, international financial institution bylaws prohibit granting debt relief or canceling debts directly. However, the recent decrease in multilateral debt service ratios for some countries reflects debt relief from special programs, such as the Heavily Indebted Poor Countries (HIPC) Debt Initiative and the Multilateral Debt Relief Initiative (MDRI) (see table 1.4.) Other countries have accelerated repayment of debt outstanding. Indebted countries may also apply to the Paris and London Clubs to renegotiate obligations to public and private creditors.

Because short-term debt poses an immediate burden and is particularly important for monitoring vulnerability, it is compared with the total debt and foreign exchange reserves that are instrumental in providing coverage for such obligations. The present value of external debt provides a measure of future debt service obligations.

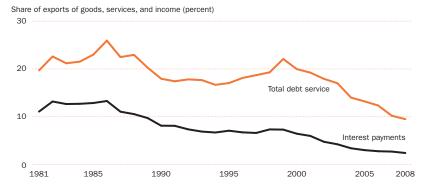

The present value of external debt is calculated by discounting the debt service (interest plus amortization) due on long-term external debt over the life of existing loans. Short-term debt is included at face value. The data on debt are in U.S. dollars converted at official exchange rates (see About the data for table 6.10). The discount rate on long-term debt depends on the currency of repayment and is based on commercial interest reference rates established by the Organisation for Economic Co-operation and Development. Loans from the International Bank for Reconstruction and Development (IBRD), credits from the International Development Association (IDA), and obligations to the IMF are discounted using a special drawing rights reference rate. When the discount rate is greater than the loan interest rate, the present value is less than the nominal sum of future debt service obligations.

Debt ratios are used to assess the sustainability of a country's debt service obligations, but no absolute rules determine what values are too high. Empirical analysis of developing countries' experience and debt service performance shows that debt service difficulties become increasingly likely when the present value of debt reaches 200 percent of exports. Still, what constitutes a sustainable debt burden varies by country. Countries with fast-growing economies and exports are likely to be able to sustain higher debt levels.

Definitions

· Total external debt is debt owed to nonresidents and comprises public, publicly guaranteed, and private nonguaranteed long-term debt, short-term debt, and use of IMF credit. It is presented as a share of GNI. • Total debt service is the sum of principal repayments and interest actually paid in foreign currency, goods, or services on long-term debt; interest paid on short-term debt; and repayments (repurchases and charges) to the IMF. • Exports of goods, services, and income refer to international transactions involving a change in ownership of general merchandise, goods sent for processing and repairs, nonmonetary gold, services, receipts of employee compensation for nonresident workers, investment income, and workers' remittances. • Multilateral debt service is the repayment of principal and interest to the World Bank, regional development banks, and other multilateral and intergovernmental agencies. • Short-term debt includes all debt having an original maturity of one year or less and interest in arrears on long-term debt. • Total reserves comprise holdings of monetary gold, special drawing rights, reserves of IMF members held by the IMF, and holdings of foreign exchange under the control of monetary authorities. • Present value of debt is the sum of short-term external debt plus the discounted sum of total debt service payments due on public, publicly guaranteed, and private nonguaranteed long-term external debt over the life of existing loans.

The total external debt service of low- and middle-income economies fell from 20 percent of export revenues in 2000 to under 10 percent in 2008. About 26 percent of the total debt service in 2008 was interest payments on outstanding debt compared with 32 percent in 2000.

Data sources

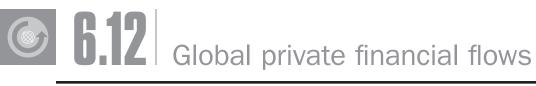

Data on external debt are mainly from reports to the World Bank through its Debtor Reporting System from member countries that have received IBRD loans or IDA credits, with additional information from the files of the World Bank, the IMF, the African Development Bank and African Development Fund, the Asian Development Bank and Asian Development Fund, and the Inter-American Development Bank. Data on GNI, exports of goods and services, and total reserves are from the World Bank's national accounts files and the IMF's Balance of Payments and International Financial Statistics databases. Summary tables of the external debt of developing countries are published annually in the World Bank's Global Development Finance, on its Global Development Finance CD-ROM, and on GDF Online.

Global private financial flows

About the data

Private financial flows—equity and debt—account for the bulk of development finance. Equity flows comprise foreign direct investment (FDI) and portfolio equity. Debt flows are financing raised through bond issuance, bank lending, and supplier credits. Data on equity flows are based on balance of payments data reported by the International Monetary Fund (IMF). FDI data are supplemented by staff estimates using data from the United Nations Conference on Trade and Development and official national sources.

The internationally accepted definition of FDI (from the fifth edition of the IMF's *Balance of Payments Manual* [1993]), includes three components: equity investment, reinvested earnings, and short- and long-term loans between parent firms and foreign affiliates. Distinguished from other kinds of international investment, FDI is made to establish a lasting interest in or effective management control over an enterprise in another country. The IMF suggests that investments should account for at least 10 percent of voting stock to be counted as FDI. In practice many countries set a higher threshold. Many countries fail to report reinvested earnings, and the definition of long-term loans differs among countries.

FDI data do not give a complete picture of international investment in an economy. Balance of payments data on FDI do not include capital raised locally, an important source of investment financing in some developing countries. In addition, FDI data omit nonequity cross-border transactions such as intrafirm flows of goods and services. For a detailed discussion of the data issues, see the World Bank's *World Debt Tables* 1993–94 (vol. 1, chap. 3).

Statistics on bonds, bank lending, and supplier credits are produced by aggregating transactions of public and publicly guaranteed debt and private nonguaranteed debt. Data on public and publicly guaranteed debt are reported through the Debtor Reporting System by World Bank member economies that have received loans from the International Bank for Reconstruction and Development or credits from the International Development Association. The reports are cross-checked with data from market sources that include transactions data. Information on private nonguaranteed bonds and bank lending is collected from market sources, because official national sources reporting to the Debtor Reporting System are not asked for a breakdown of private nonguaranteed bonds and loans.

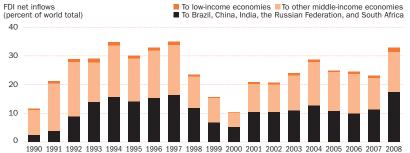

Data on equity flows are shown for all countries for which data are available. Debt flows are shown only for 128 developing countries that report to the Debtor Reporting System; nonreporting countries may also receive debt flows.

The volume of global private financial flows reported by the World Bank generally differs from that reported by other sources because of differences in sources, classification of economies, and method used to adjust and disaggregate reported information. In addition, particularly for debt financing, differences may also reflect how some installments of the transactions and certain offshore issuances are treated.

Definitions

• Foreign direct investment is net inflows of investment to acquire a lasting interest in or management control over an enterprise operating in an economy other than that of the investor. It is the sum of equity capital, reinvested earnings, other long-term capital, and short-term capital, as shown in the balance of payments. . Portfolio equity includes net inflows from equity securities other than those recorded as direct investment and including shares, stocks, depository receipts, and direct purchases of shares in local stock markets by foreign investors • Bonds are securities issued with a fixed rate of interest for a period of more than one year. They include net flows through cross-border public and publicly guaranteed and private nonguaranteed bond issues. • Commercial bank and other lending includes net commercial bank lending (public and publicly guaranteed and private nonguaranteed) and other private credits.

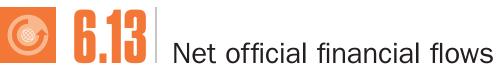

The share of FDI net inflows to developing economies increased 10 percentage points between 2007 and 2008 because of decreasing inflows to high-income economies. Brazil, China, India, the Russian Federation, and South Africa received more than half the FDI net inflows to all developing economies.

Data sources

6.12a

Data on equity and debt flows are compiled from a variety of public and private sources, including the World Bank's Debtor Reporting System, the IMF's International Financial Statistics and Balance of Payments databases, and Dealogic. These data are also published annually in the World Bank's Global Development Finance, on its Global Development Finance CD-ROM, and on GDF Online.

a. Aggregates include amounts for economies that do not report to the World Bank's Debtor Reporting System and may differ from aggregates published in Global Development Finance 2010.

b. Aggregates include amounts for economies not specified elsewhere. c. World and income group aggregates include flows not allocated by country or region.

The table shows concessional and nonconcessional financial flows from official bilateral sources, the major international financial institutions, and UN agencies. The international financial institutions fund nonconcessional lending operations primarily by selling low-interest, highly rated bonds backed by prudent lending and financial policies and the strong financial support of their members. Funds are then on-lent to developing countries at slightly higher interest rates with 15- to 20-year maturities. Lending terms vary with market conditions and institutional policies.

Concessional flows from international financial institutions are credits provided through concessional lending facilities. Subsidies from donors or other resources reduce the cost of these loans. Grants are not included in net flows. The Organisation for Economic Co-operation and Development's (OECD) Development Assistance Committee (DAC) defines concessional flows from bilateral donors as flows with a grant element of at least 25 percent, evaluated assuming a 10 percent nominal discount rate.

World Bank concessional lending is done by the International Development Association (IDA) based on gross national income (GNI) per capita and performance standards assessed by World Bank staff. Cutoff for IDA eligibility, set at the beginning of the World Bank's fiscal year, has been \$1,135 since July 1, 2009, measured in 2008 U.S. dollars using the Atlas method (see Users guide). In exceptional circumstances IDA extends temporary eligibility to countries above the cutoff that are undertaking major adjustments but are not

creditworthy for International Bank for Reconstruction and Development (IBRD) lending. Exceptions are also made for small island economies. The IBRD lends to creditworthy countries at a variable base rate of sixmonth LIBOR plus a spread, either variable or fixed, for the life of the loan. The rate is reset every six months and applies to the interest period beginning on that date. Although some outstanding IBRD loans have a low enough interest rate to be classified as concessional under the DAC definition, all IBRD loans in the table are classified as nonconcessional. Lending by the International Finance Corporation is not included.

The International Monetary Fund makes concessional funds available through its Poverty Reduction and Growth Facility and the IMF Trust Fund. Eligibility is based principally on a country's per capita income and eligibility under IDA.

Regional development banks also maintain concessional windows. Their loans are recorded in the table according to each institution's classification and not according to the DAC definition.

Data for flows from international financial institutions are available for 128 countries that report to the World Bank's Debtor Reporting System. World Bank flows for nonreporting countries were collected from its operational records. Nonreporting countries may have net flows from other international financial institutions.

Official flows from the United Nations are mainly concessional flows classified as official development assistance but may include nonconcessional flows classified

as other official flows in OECD-DAC databases. Net lending from the International Bank for Reconstruction and Development declined as countries paid off loans, and concessional lending from the **International Development Association increased** 6.13a Net inflows (\$ billions) **1990 2008** 3.000 2 000 1.000 -1,000 Europe & Central Fast Latin Middle East South Sub-Saharan

All regions except Middle East and North Africa and Sub-Saharan Africa received positive net disbursements from the IBRD. The world's poorest countries in Sub-Saharan Africa continue to receive concessional lending from the International Development Association.

Source: Global Development Finance data files.

Definitions

 Total net official financial flows are disbursements of public or publicly guaranteed loans and credits, less repayments of principal. • IDA is the International Development Association, the concessional loan window of the World Bank Group. • IBRD is the International Bank for Reconstruction and Development, the founding and largest member of the World Bank Group. • IMF is the International Monetary Fund, which provides concessional lending through the Poverty Reduction and Growth Facility and the IMF Trust Fund and nonconcessional lending through credit to its members, mainly for balance of payments needs. • Regional development banks are the African Development Bank, which serves all of Africa, including North Africa; the Asian Development Bank, which serves South and Central Asia and East Asia and Pacific; the European Bank for Reconstruction and Development, which serves Europe and Central Asia; and the Inter-American Development Bank, which serves the Americas. • Concessional financial flows are disbursements made through concessional lending facilities. . Nonconcessional financial flows are all disbursements that are not concessional. . Other institutions, a residual category in the World Bank's Debtor Reporting System, includes other multilateral institutions such as the Caribbean Development Fund, Council of Europe, European Development Fund, Islamic Development Bank, and Nordic Development Fund. • United Nations includes the United Nations Children's Fund (UNICEF). United Nations Relief and Works Agency for Palestine Refugees in the Near East (UNRWA), United Nations Regular Programme for Technical Assistance (UNTA), and other UN agencies, such as the International Fund for Agricultural Development, Joint United Nations Programme on HIV/AIDS, United Nations Development Programme, United Nations Population Fund, United Nations Refugee Agency, and World Food Programme.

Data sources

Data on net financial flows from international financial institutions are from the World Bank's Debtor Reporting System and published annually in the World Bank's Global Development Finance, on its Global Development Finance CD-ROM, and on GDF Online. Data on official flows from UN agencies are from the OECD DAC annual Development Co-operation Report and are available electronically on the OECD DAC's International Development Statistics CD-ROM and at www.oecd.org/ dac/stats/idsonline.

About the data

The flows of official and private financial resources from the members of the Development Assistance Committee (DAC) of the Organisation for Economic Co-operation and Development (OECD) to developing economies are compiled by DAC, based principally on reporting by DAC members using standard questionnaires issued by the DAC Secretariat.

The table shows data reported by DAC member economies and does not include aid provided by the European Commission—a multilateral member of

DAC exists to help its members coordinate their development assistance and to encourage the expansion and improve the effectiveness of the aggregate resources flowing to recipient economies. In this capacity DAC monitors the flow of all financial resources, but its main concern is official development assistance (ODA). Grants or loans to countries and territories on the DAC list of aid recipients have to meet three criteria to be counted as ODA. They are undertaken by the official sector. They promote economic development and welfare as the main objective. And they are provided on concessional financial terms (loans must have a grant element of at least 25 percent, calculated at a discount rate of 10 percent). The DAC Statistical Reporting Directives provide the most detailed explanation of this definition and all ODA-related rules.

This definition excludes nonconcessional flows from official creditors, which are classified as "other official flows," and aid for military purposes. Transfer payments to private individuals, such as pensions, reparations, and insurance payouts, are in general not counted. In addition to financial flows, ODA includes technical cooperation, most expenditures for peacekeeping under UN mandates and assistance to refugees, contributions to multilateral institutions such as the United Nations and its specialized agencies, and concessional funding to multilateral development banks.

A DAC revision of the list of countries and territories counted as aid recipients has governed aid reporting for the three years starting in 2005. In the past DAC distinguished aid going to Part I and Part II countries. Part I countries, the recipients of ODA, comprised many of the countries classified by the World Bank as low- and middle-income economies. Part II countries, whose assistance was designated official aid, included the more advanced countries of Central and Eastern Europe, countries of the former Soviet Union, and certain advanced developing countries and territories. This distinction has been dropped. ODA recipients now comprise all low- and middle-income countries except those that are members of the Group of Eight or the European Union (including countries with a firm date for EU accession). The content and structure of tables 6.14-6.17 were revised to reflect this change. Because official aid flows are quite small relative to ODA, the net effect of these changes is believed to be minor.

Flows are transfers of resources, either in cash or in the form of commodities or services measured on a cash basis. Short-term capital transactions (with one year or less maturity) are not counted. Repayments of the principal (but not interest) of ODA loans are recorded as negative flows. Proceeds from official equity investments in a developing country are reported as ODA, while proceeds from their later sale are recorded as negative flows.

The table is based on donor country reports and does not provide a complete picture of the resources received by developing economies for two reasons. First, flows from DAC members are only part of the aggregate resource flows to these economies. Second, the data that record contributions to multilateral institutions measure the flow of resources made available to those institutions by DAC members, not the flow of resources from those institutions to developing and transition economies.

Aid as a share of gross national income (GNI), aid per capita, and ODA as a share of the general government disbursements of the donor are calculated by the OECD. The denominators used in calculating these ratios may differ from corresponding values elsewhere in this book because of differences in timing or definitions.

· Net disbursements are gross disbursements of

grants and loans minus repayments of principal on

Definitions

earlier loans. • Total net flows are ODA or official aid flows, other official flows, private flows, and net grants by nongovernmental organizations. • Official development assistance refers to flows that meet the DAC definition of ODA and are made to countries and territories on the DAC list of aid recipients. · Bilateral grants are transfers of money or in kind for which no repayment is required. • Bilateral loans are loans extended by governments or official agencies with a grant element of at least 25 percent (at a 10 percent discount rate). • Contributions to multilateral institutions are concessional funding received by multilateral institutions from DAC members as grants or capital subscriptions. • Other official flows

are transactions by the official sector whose main objective is other than development or whose grant element is less than 25 percent. • Private flows are flows at market terms financed from private sector resources in donor countries. They include changes in holdings of private long-term assets by reporting country residents. • Foreign direct investment is investment by residents of DAC member countries to acquire a lasting management interest (at least 10 percent of voting stock) in an enterprise operating in the recipient country. The data reflect changes in the net worth of subsidiaries in recipient countries whose parent company is in the DAC source country. • Bilateral portfolio investment is bank lending and the purchase of bonds, shares, and real estate by residents of DAC member countries in recipient countries. • Multilateral portfolio investment is transactions of private banks and nonbanks in DAC member countries in the securities issued by multilateral institutions. • Private export credits are loans extended to recipient countries by the private sector in DAC member countries to promote trade; they may be supported by an official guarantee. • Net grants by nongovernmental organizations (NGOs) are private grants by NGOs, net of subsidies from the official sector. • Commitments are obligations, expressed in writing and backed by funds, undertaken by an official donor to provide specified assistance to a recipient country or multilateral organization. • Gross disbursements are the international transfer of financial resources, goods, and services, valued at the cost to the donor.

Data sources

Data on financial flows are compiled by OECD DAC and published in its annual statistical report, Geographical Distribution of Financial Flows to Developing Countries, and its annual Development Co-operation Report. Data are available electronically on the OECD-DAC's International Development Statistics CD-ROM and at www.oecd.org/ dac/stats/idsonline.

a. At current exchange rates and prices. b. Includes aid for promoting development awareness and aid provided to refugees in donor economies.

About the data

Aid can be used in many ways. The sector to which aid goes, the form it takes, and the procurement restrictions attached to it are important influences on aid effectiveness. The data on allocation of official development assistance (ODA) in the table are based principally on reporting by members of the Organisation for Economic Co-operation and Development (OECD) Development Assistance Committee (DAC). For more detailed explanation of ODA, see About the data for table 6.14.

The form in which an ODA contribution reaches the benefiting sector or the economy is important. A distinction is made between resource provision and technical cooperation. Resource provision involves mainly cash or in-kind transfers and financing of capital projects, with the deliverables being financial support and the provision of commodities and supplies. Technical cooperation includes grants to nationals of aid-recipient countries receiving education or training at home or abroad, and payments to consultants, advisers, and similar personnel and to teachers and administrators serving in recipient countries. Technical cooperation is spent mostly in the donor economy.

Two other types of aid are presented because they serve distinctive purposes. Debt-related aid aims to

provide debt relief on liabilities that recipient countries have difficulty servicing. Thus, this type of aid may not provide a full value of new resource flows for development, in particular for heavily indebted poor countries. Humanitarian assistance provides relief following sudden disasters and supports food programs in emergency situations. This type of aid does not generally contribute to financing long-term development.

Definitions

• Net disbursements are gross disbursements of grants and loans minus repayments of principal on earlier loans • Development projects, programs, and other resource provisions are aid provided as cash transfers, aid in kind, development food aid, and the financing of capital projects, intended to increase or improve the recipient's stock of physical capital and to support recipient's development plans and other activities with finance and commodity supply. • Technical cooperation is the provision of resources whose main aim is to augment the stock of human intellectual capital, such as the level of knowledge, skills, and technical know-how in the recipient country (including the cost of associated equipment). Contributions take the form mainly of the supply of

human resources from donors or action directed to human resources (such as training or advice). Also included are aid for promoting development awareness and aid provided to refugees in the donor economy. Assistance specifically to facilitate a capital project is not included. • Debt-related aid groups all actions relating to debt, including forgiveness, swaps, buybacks, rescheduling, and refinancing. • Humanitarian assistance is emergency and dis-

tress relief (including aid to refugees and assistance for disaster preparedness). • Administrative costs are the total current budget outlays of institutions responsible for the formulation and implementation of donor's aid programs and other administrative costs incurred by donors in aid delivery.

Data sources

Data on aid flows are published by OECD DAC in its annual statistical report, Geographical Distribution of Financial Flows to Developing Countries, and its annual Development Co-operation Report. Data are available electronically on the OECD DAC's International Development Statistics CD-ROM and at www. oecd.org/dac/stats/idsonline.

a. Excludes technical cooperation and administrative costs. b. Gross disbursements

About the data

The Development Assistance Committee (DAC) records the sector classification of aid using a three-level hierarchy. The top level is grouped by themes, such as social infrastructure and services; economic infrastructure, services, and production; and multisector or cross-cutting areas. The second level is more specific. Education and health and transport and storage are examples. The third level comprises subsectors such as basic education and basic health. Some contributions are reported as non-sector-allocable aid.

Reporting on the sectoral destination and the form of aid by donors may not be complete. Also, measures of aid allocation may differ from the perspectives of donors and recipients because of difference in classification, available information, and recording time.

The proportion of untied aid is reported because tying arrangements may prevent recipients from obtaining the best value for their money. Tying requires recipients to purchase goods and services from the donor country or from a specified group of countries. Such arrangements prevent a recipient from misappropriating or mismanaging aid receipts, but they may also be motivated by a desire to benefit donor country suppliers.

Definitions

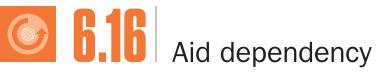

- Bilateral official development assistance (ODA) commitments are firm obligations, expressed in writing and backed by the necessary funds, undertaken by official bilateral donors to provide specified assistance to a recipient country or a multilateral organization. Bilateral commitments are recorded in the full amount of expected transfer, irrespective of the time required for completing disbursements.
- Total sector-allocable aid is the sum of aid that can be assigned to specific sectors or multisector activities. • Social infrastructure and services refer to efforts to develop the human resources potential of aid recipients. • Education refers to general teaching and instruction at all levels, as well as construction to improve or adapt educational establishments. Training in a particular field is reported for the sector concerned. • Health refers to assistance to hospitals, clinics, other medical and dental services, public health administration, and medical insurance programs. • Population refers to all activities related to family planning and research into population problems. • Water supply and sanitation refer to assistance for water supply and use, sanitation, and water resources development (including rivers).
- **Government and civil society** refer to assistance to strengthen government administrative apparatus

and planning and activities promoting good governance and civil society. • Economic infrastructure,
services, and production sector group assistance
for networks, utilities, services that facilitate economic activity, and contributions to all directly productive sectors. • Transport and communication
refer to road, rail, water, and air transport; post
and telecommunications; and television and print
media. • Agriculture refers to sector policy, development, and inputs; crop and livestock production;
and agricultural credit, cooperatives, and research.

• Multisector or cross-cutting refers to support for projects that straddle several sectors. • Untied aid is ODA not subject to restrictions by donors on procurement sources.

Data sources

Data on aid flows are published annually by the Organisation for Economic Co-operation and Development (OECD) DAC in Geographical Distribution of Financial Flows to Developing Countries and Development Co-operation Report. Data are available electronically on the OECD DAC's International Development Statistics CD-ROM and at www.oecd.org/dac/stats/idsonline.

Note: Regional aggregates include data for economies not listed in the table. World and income group totals include aid not allocated by country or region—including administrative costs, research on development issues, and aid to nongovernmental organizations. Thus regional and income group totals do not sum to the world total.

a. Includes Montenegro.

About the data

Unless otherwise noted, aid includes official development assistance (ODA; see About the data for table 6.14). The data cover loans and grants from Development Assistance Committee (DAC) member countries, multilateral organizations, and non-DAC donors. They do not reflect aid given by recipient countries to other developing countries. As a result, some countries that are net donors (such as Saudi Arabia) are shown in the table as aid recipients (see table 6.16a). Aid given before 2005 to countries that were Part II recipients (see About the data for table 6.14 for more information) is defined as official aid.

The table does not distinguish types of aid (program, project, or food aid; emergency assistance; postconflict peacekeeping assistance; or technical cooperation), which may have different effects on the economy. Expenditures on technical cooperation do not always directly benefit the economy to the extent that they defray costs incurred outside the country on salaries and benefits of technical experts and overhead costs of firms supplying technical services.

Ratios of aid to gross national income (GNI), gross capital formation, imports, and government spending provide measures of recipient country dependency on aid. But care must be taken in drawing policy conclusions. For foreign policy reasons some countries have traditionally received large amounts of aid. Thus aid dependency ratios may reveal as much about a donor's interests as about a recipient's needs. Ratios are generally much higher in Sub-Saharan Africa than in other regions, and they increased in the 1980s. High ratios are due only in part to aid flows. Many African countries saw severe erosion in their terms of trade in the 1980s, which, along with weak policies, contributed to falling incomes, imports, and investment. Thus the increase in aid dependency ratios reflects events affecting both the numerator (aid) and the denominator (GNI).

Because the table relies on information from donors, it is not necessarily consistent with information recorded by recipients in the balance of payments, which often excludes all or some technical assistance—particularly payments to expatriates made directly by the donor. Similarly, grant commodity aid may not always be recorded in trade data or in the balance of payments. Moreover, DAC statistics exclude purely military aid.

The nominal values used here may overstate the real value of aid to recipients. Changes in international prices and exchange rates can reduce the purchasing power of aid. Tying aid, still prevalent though declining in importance, also tends to reduce its purchasing power (see About the data for table 6.15).

The aggregates refer to World Bank definitions. Therefore the ratios shown may differ from those of the Organisation for Economic Co-operation and Development (OECD).

Definitions

• Net official development assistance is flows (net of repayment of principal) that meet the DAC definition of ODA and are made to countries and territories on the DAC list of aid recipients. See About the data for table 6.14. • Net official development assistance per capita is net ODA divided by midyear population.

• Aid dependency ratios are calculated using values in U.S. dollars converted at official exchange rates. Imports of goods, services, and income refer to international transactions involving a change in ownership of general merchandise, goods sent for processing and repairs, nonmonetary gold, services, receipts of employee compensation for nonresident workers, and investment income. For definitions of GNI, gross capital formation, and central government expense, see Definitions for tables 1.1, 4.8, and 4.10.

6.16a Official development assistance from non-DAC donors, 2004–08

Not dishursements (\$ millions)

Note: The table does not reflect aid provided by several major emerging non-Organisation for Economic Co-operation and Development donors because information on their aid has not been disclosed.

a. The Republic of Korea became a DAC member in November 2009. Its disbursements will be reflected in DAC data beginning with 2010 flows. b. Includes \$47.9 million in 2004, \$49.2 million in 2005, \$45.5 million in 2006, \$42.9 million in 2007, and \$43.0 million in 2008 for first-year sustenance expenses for people arriving from developing countries (many of which are experiencing civil war or severe unrest) or people who have left their country for humanitarian or political reasons. Source: Organisation for Economic Co-operation and Development.

Data on financial flows are compiled by OECD DAC and published in its annual statistical report, Geographical Distribution of Financial Flows to Developing Countries, and in its annual Development Co-operation Report. Data are available electronically on the OECD DAC's International Development Statistics CD-ROM and at www.oecd.org/dac/ stats/idsonline. Data on population, GNI, gross capital formation, imports of goods and services, and central government expense used in computing the ratios are from World Bank and International Monetary Fund databases.

Note: Regional aggregates include data for economies not specified elsewhere. World and income group totals include aid not allocated by country or region.

About the data

The table shows net bilateral aid to low- and middleincome economies from members of the Development Assistance Committee (DAC) of the Organisation for Economic Co-operation and Development (OECD). The data include aid to some countries and territories not shown in the table and aid to unspecified economies recorded only at the regional or global level. Aid to countries and territories not shown in the table has been assigned to regional totals based on the World Bank's regional classification system. Aid to unspecified economies is included in regional totals and, when possible, income group totals. Aid not allocated by country or region-including administrative costs, research on development, and aid to nongovernmental organizations—is included in the world total. Thus regional and income group totals do not sum to the world total.

The table is based on donor country reports of bilateral programs, which may differ from reports by recipient countries. Recipients may lack access to information on such aid expenditures as development-oriented research, stipends and tuition costs for aid-financed students in donor countries,

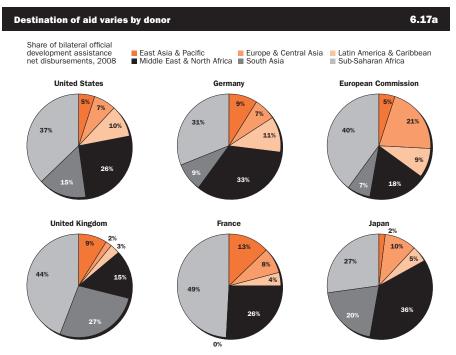

and payment of experts hired by donor countries. Moreover, a full accounting would include donor country contributions to multilateral institutions, the flow of resources from multilateral institutions to recipient countries, and flows from countries that are not members of DAC. Previous editions of the table included only DAC member economies. The table also includes net aid from the European Commission—a multilateral member of DAC.

The expenditures that countries report as official development assistance (ODA) have changed. For example, some DAC members have reported as ODA the aid provided to refugees during the first 12 months of their stay within the donor's borders.

Some of the aid recipients shown in the table are also aid donors. See table 6.16a for a summary of ODA from non-DAC countries.

Definitions

• Net aid refers to net bilateral official development assistance that meets the DAC definition of official development assistance and is made to countries and territories on the DAC list of aid recipients. See About the data for table 6.14. • Other DAC donors are Australia, Austria, Belgium, Denmark, Finland, Greece, Ireland, Italy, Luxembourg, New Zealand, Norway, Portugal, and Switzerland.

In 2008 Sub-Saharan Africa received 38 percent of total bilateral net official development assistance disbursements from Development Assistance Committee (DAC) donors, and the Middle East and North Africa received 22 percent. However, destinations of aid vary by donor.

Note: Data are the distribution of bilateral aid from the top six DAC donors in 2008 and exclude aid to high-income economies (less than 1 percent of bilateral aid) and aid unallocated by region.

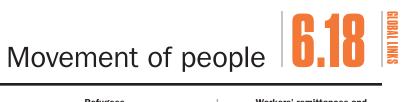

Source: Organisation for Economic Co-operation and Development, Development Assistance Committee.

Data sources

Data on financial flows are compiled by OECD DAC and published in its annual statistical report, Geographical Distribution of Financial Flows to Developing Countries, and its annual Development Co-operation Report. Data are available electronically on the OECD DAC's International Development Statistics CD-ROM and at www.oecd.org/dac/stats/idsonline.

a. World Bank estimates, b. Includes Taiwan, China. c. Includes Tibetans, who are listed separately by the UN Refugee Agency (UNHCR). d. Includes Palestinian refugees under the mandate of the United Nations Relief and Works Agency for Palestine Refugees in the Near East (UNRWA), who are not included in data from the UNHCR. e. Includes Montenegro. f. World totals computed by the United Nations sum to zero, but because the aggregates refer to World Bank definitions, regional and income group totals do not. g. World totals are computed by the World Bank and include only economies covered by World Development Indicators, so data may differ from what is published by the United Nations Population Division. h. Includes refugees without specified country of origin and Palestinian refugees under the mandate of the UNRWA, so regional and income group totals do not sum to the world total.

About the data

Movement of people, most often through migration, is a significant part of global integration. Migrants contribute to the economies of both their host country and their country of origin. Yet reliable statistics on migration are difficult to collect and are often incomplete, making international comparisons a challenge.

The United Nations Population Division provides data on net migration and migrant stock. To derive estimates of net migration, the organization takes into account the past migration history of a country or area, the migration policy of a country, and the influx of refugees in recent periods. The data to calculate these official estimates come from a variety of sources, including border statistics, administrative records, surveys, and censuses. When no official estimates can be made because of insufficient data, net migration is derived through the balance equation, which is the difference between overall population growth and the natural increase during the 1990–2000 intercensal period.

The data used to estimate the international migrant stock at a particular time are obtained mainly from population censuses. The estimates are derived from the data on foreign-born population—people who have residence in one country but were born in another country. When data on the foreign-born population are not available, data on foreign population—that is, people who are citizens of a country other than the country in which they reside—are used as estimates.

After the breakup of the Soviet Union in 1991 people living in one of the newly independent countries who were born in another were classified as international migrants. Estimates of migrant stock in the newly independent states from 1990 on are based on the 1989 census of the Soviet Union.

For countries with information on the international migrant stock for at least two points in time, interpolation or extrapolation was used to estimate the international migrant stock on July 1 of the reference years. For countries with only one observation, estimates for the reference years were derived using rates of change in the migrant stock in the years preceding or following the single observation available. A model was used to estimate migrants for countries that had no data.

Registrations, together with other sources—including estimates and surveys—are the main sources of refugee data. But there are difficulties in collecting accurate statistics. Although refugees are often registered individually, the accuracy of

registrations varies greatly. Many refugees may not be aware of the need to register or may choose not to do so. And administrative records tend to overestimate the number of refugees because it is easier to register than to de-register. The UN Refugee Agency (UNHCR) collects and maintains data on refugees, except for Palestinian refugees residing in areas under the mandate of the United Nations Relief and Works Agency for Palestine Refugees in the Near East (UNRWA). The UNRWA provides services to Palestinian refugees who live in certain areas and who register with the agency. Registration is voluntary, and estimates by the UNRWA are not an accurate count of the Palestinian refugee population. The table shows estimates of refugees collected by the UNHCR, complemented by estimates of Palestinian refugees under the UNRWA mandate. Thus, the aggregates differ from those published by

Workers' remittances and compensation of employees are World Bank staff estimates based on data from the International Monetary Fund's (IMF) Balance of Payments Statistics Yearbook. The IMF data are supplemented by World Bank staff estimates for missing data for countries where workers' remittances are important. The data reported here are the sum of three items defined in the fifth edition of the IMF's Balance of Payments Manual: workers' remittances, compensation of employees, and migrants' transfers.

The distinction among these three items is not always consistent in the data reported by countries to the IMF. In some cases countries compile data on the basis of the citizenship of migrant workers rather than their residency status. Some countries also report remittances entirely as workers' remittances or compensation of employees. Following the fifth edition of the *Balance of Payments Manual* in 1993, migrants' transfers are considered a capital transaction, but previous editions regarded them as current transfers. For these reasons the figures presented in the table take all three items into account.

Definitions

. Net migration is the net total of migrants during the period. It is the total number of immigrants less the total number of emigrants, including both citizens and noncitizens. Data are five-year estimates. • International migrant stock is the number of people born in a country other than that in which they live. It includes refugees. • Refugees are people who are recognized as refugees under the 1951 Convention Relating to the Status of Refugees or its 1967 Protocol, the 1969 Organization of African Unity Convention Governing the Specific Aspects of Refugee Problems in Africa, people recognized as refugees in accordance with the UNHCR statute, people granted refugee-like humanitarian status, and people provided temporary protection. Asylum seekers—people who have applied for asylum or refugee status and who have not yet received a decision or who are registered as asylum seekers-are excluded. Palestinian refugees are people (and their descendants) whose residence was Palestine between June 1946 and May 1948 and who lost their homes and means of livelihood as a result of the 1948 Arab-Israeli conflict. • Country of origin refers to the nationality or country of citizenship of a claimant. • Country of asylum is the country where an asylum claim was filed and granted. • Workers' remittances and compensation of employees received and paid comprise current transfers by migrant workers and wages and salaries earned by nonresident workers. Remittances are classified as current private transfers from migrant workers resident in the host country for more than a year, irrespective of their immigration status, to recipients in their country of origin. Migrants' transfers are defined as the net worth of migrants who are expected to remain in the host country for more than one year that is transferred to another country at the time of migration. Compensation of employees is the income of migrants who have lived in the host country for less than a year.

Data sources

Data on net migration are from the United Nations Population Division's World Population Prospects: The 2008 Revision. Data on migration stock are from the United Nations Population Division's Trends in Total Migrant Stock: The 2008 Revision. Data on refugees are from the UNHCR's Statistical Yearbook 2008, complemented by statistics on Palestinian refugees under the mandate of the UNRWA as published on its website. Data on remittances are World Bank staff estimates based on IMF balance of payments data.

Note: Aggregates are based on World Bank country classifications and differ from those of the World Tourism Organization. Regional and income group totals include countries not shown in the table for which data are available.

a. Arrivals of nonresident visitors at national borders. b. Includes nationals residing abroad. c. Country estimates. d. Arrivals in all types of accommodation establishments. e. Expenditure of travel related items only; excludes passenger transport items. f. Arrivals in hotels and similar establishments. g. Arrivals by air only. h. Excludes nationals residing abroad. i. Arrivals in hotels only.

About the data

Tourism is defined as the activities of people traveling to and staying in places outside their usual environment for no more than one year for leisure, business, and other purposes not related to an activity remunerated from within the place visited. The social and economic phenomenon of tourism has grown substantially over the past quarter century.

Statistical information on tourism is based mainly on data on arrivals and overnight stays along with balance of payments information. These data do not completely capture the economic phenomenon of tourism or provide the information needed for effective public policies and efficient business operations. Data are needed on the scale and significance of tourism. Information on the role of tourism in national economies is particularly deficient. Although the World Tourism Organization reports progress in harmonizing definitions and measurement, differences in national practices still prevent full comparability.

The data in the table are from the World Tourism Organization, a United Nations agency. The data on inbound and outbound tourists refer to the number of arrivals and departures, not to the number of people traveling. Thus a person who makes several trips to a country during a given period is counted each time as a new arrival. Unless otherwise indicated in the footnotes, the data on inbound tourism show the arrivals of nonresident tourists (overnight visitors) at national borders. When data on international tourists

are unavailable or incomplete, the table shows the arrivals of international visitors, which include tourists, same-day visitors, cruise passengers, and crew members

Sources and collection methods for arrivals differ across countries. In some cases data are from border statistics (police, immigration, and the like) and supplemented by border surveys. In other cases data are from tourism accommodation establishments. For some countries number of arrivals is limited to arrivals by air and for others to arrivals staying in hotels. Some countries include arrivals of nationals residing abroad while others do not. Caution should thus be used in comparing arrivals across countries.

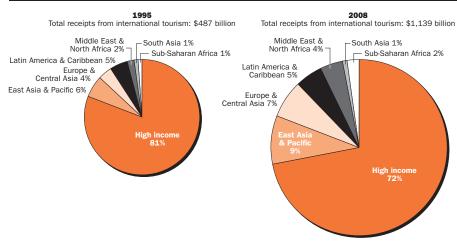

The World Tourism Organization is improving its coverage of tourism expenditure data, using balance of payments data from the International Monetary Fund (IMF) supplemented by data from individual countries. These data, shown in the table, include travel and passenger transport items as defined in the IMF's (1993) Balance of Payments Manual. When the IMF does not report data on passenger transport items, expenditure data for travel items are shown.

The aggregates are calculated using the World Bank's weighted aggregation methodology (see Statistical methods) and differ from the World Tourism Organization's aggregates.

Definitions

 International inbound tourists (overnight visitors) are the number of tourists who travel to a country other than that in which they usually reside, and outside their usual environment, for a period not exceeding 12 months and whose main purpose in visiting is other than an activity remunerated from within the country visited. When data on number of tourists are not available, the number of visitors, which includes tourists, same-day visitors, cruise passengers, and crew members, is shown instead. • International outbound tourists are the number of departures that people make from their country of usual residence to any other country for any purpose other than an activity remunerated in the country visited. . Inbound tourism expenditure is expenditures by international inbound visitors, including payments to national carriers for international transport. These receipts include any other prepayment made for goods or services received in the destination country. They may include receipts from same-day visitors, except when these are important enough to justify separate classification. For some countries they do not include receipts for passenger transport items. Their share in exports is calculated as a ratio to exports of goods and services (all transactions between residents of a country and the rest of the world involving a change of ownership from residents to nonresidents of general merchandise, goods sent for processing and repairs, nonmonetary gold, and services). • Outbound tourism expenditure is expenditures of international outbound visitors in other countries, including payments to foreign carriers for international transport. These expenditures may include those by residents traveling abroad as same-day visitors, except when these are important enough to justify separate classification. For some countries they do not include expenditures for passenger transport items. Their share in imports is calculated as a ratio to imports of goods and services (all transactions between residents of a country and the rest of the world involving a change of ownership from nonresidents to residents of general merchandise, goods sent for processing and repairs, nonmonetary gold, and services).

High-income economies remain the main recipients of increased international tourism expenditure, but the share of developing economies' receipts has risen 6.19a

Although more than 70 percent of international tourism expenditures went to high-income economies in 2008, the share of developing economies' receipts has increased since 1995. The share of receipts by East Asia and Pacific and Europe and Central Asia increased the most—about 3 percentage points.

Source: World Bank staff calculations based on World Tourism Organization data.

Data sources

Data on visitors and tourism expenditure are from the World Tourism Organization's Yearbook of Tourism Statistics and Compendium of Tourism Statistics 2010. Data in the table are updated from electronic files provided by the World Tourism Organization. Data on exports and imports are from the IMF's Balance of Payments Statistics Yearbook and data files.

As a major user of socioeconomic data, the World Bank recognizes the importance of data documentation to inform users of differences in the methods and conventions used by primary data collectors—usually national statistical agencies, central banks, and customs services—and by international organizations, which compile the statistics that appear in the World Development Indicators database. These differences may give rise to significant discrepancies over time both within countries and across them. Delays in reporting data and the use of old surveys as the base for current estimates may further compromise the quality of data reported here.

The tables in this section provide information on sources, methods, and reporting standards of the principal demographic, economic, and environmental indicators in *World Development Indicators*. Additional documentation is available from the World Bank's Country Statistical Information Database at www. worldbank.org/data.

The demand for good-quality statistical data is increasing. Timely and reliable statistics are key to the broad development strategy often referred to as "managing for results." Monitoring and reporting on publicly agreed indicators are central to implementing poverty reduction strategies and lie at the heart of the Millennium Development Goals and the new Results Measurement System adopted for the 14th replenishment of the International Development Association.

A global action plan to improve national and international statistics was agreed on during the Second Roundtable on Managing for Development Results in February 2004 in Marrakech, Morocco. The plan, now referred to as the Marrakech Action Plan for Statistics, or MAPS, has been widely endorsed and forms the overarching framework for statistical capacity building. The third roundtable conference, held in February 2007 in Hanoi, Vietnam, reaffirmed MAPS as the guiding strategy for improving the capacity of the national and international statistical systems. See www.mfdr.org/RT3 for reports from the conference.

 $\textbf{Note:} \ \ \text{For explanation of the abbreviations used in the table see notes following the table.}$

a. Original chained constant price data are rescaled. b. Country uses the 1993 System of National Accounts methodology. c. Register based. d. Conducted annually. e. Rolling. f. Reporting period switch from fiscal year to calendar year from 1996. Pre-1996 data converted to calendar year.

. Base year is the base or pricing period used for constant price calculations in the country's national accounts. Price indexes derived from national accounts aggregates, such as the implicit deflator for gross domestic product (GDP), express the price level relative to base year prices. • Reference year is the year in which the local currency, constant price series of a country is valued. The reference year is usually the same as the base year used to report the constant price series. However, when the constant price data are chain linked, the base year is changed annually, so the data are rescaled to a specific reference year to provide a consistent time series. When the country has not rescaled following a change in base year, World Bank staff rescale the data to maintain a longer historical series. To allow for cross-country comparison and data aggregation, constant price data reported in World Development Indicators are rescaled to a common reference year (2000) and currency (U.S. dollars). • System of National Accounts identifies countries that use the 1993 System of National Accounts (1993 SNA), the terminology applied in World Development Indicators since 2001. to compile national accounts. Although more countries are adopting the 1993 SNA, many still follow the 1968 SNA, and some low-income countries use concepts from the 1953 SNA. \bullet SNA price valuation shows whether value added in the national accounts is reported at basic prices (VAB) or producer prices (VAP). Producer prices include taxes paid by producers and thus tend to overstate the actual value added in production. However, VAB can be higher than VAP in countries with high agricultural subsidies. See About the data for tables 4.1 and 4.2 for further discussion of national accounts valuation. . Alternative conversion factor identifies the countries and years for which a World Bank-estimated conversion factor has been used in place of the official exchange rate (line rf in the International Monetary Fund's [IMF] International Financial Statistics). See Statistical methods for further discussion of alternative conversion factors. • Purchasing power parity (PPP) survey year is the latest available survey year for the International Comparison Program's estimates of PPPs. See About the data for table 1.1 for a more detailed description of PPPs. • Balance of Payments Manual in use refers to the classification system used to compile and report data on balance of payments items in table 4.15. BPM4 refers to the 4th edition of the IMF's Balance of Payments Manual (1977), and BPM5 to the 5th edition (1993). • External debt shows debt reporting status for 2008 data. Actual indicates that data are as reported, preliminary that data are based on reported or collected information but include an

element of staff estimation, and estimate that data are World Bank staff estimates. . System of trade refers to the United Nations general trade system (G) or special trade system (S). Under the general trade system goods entering directly for domestic consumption and goods entered into customs storage are recorded as imports at arrival. Under the special trade system goods are recorded as imports when declared for domestic consumption whether at time of entry or on withdrawal from customs storage. Exports under the general system comprise outwardmoving goods: (a) national goods wholly or partly produced in the country; (b) foreign goods, neither transformed nor declared for domestic consumption in the country, that move outward from customs storage; and (c) nationalized goods that have been declared for domestic consumption and move outward without being transformed. Under the special system of trade, exports are categories a and c. In some compilations categories b and c are classified as re-exports. Direct transit trade—goods entering or leaving for transport only—is excluded from both import and export statistics. See About the data for tables 4.4, 4.5, and 6.2 for further discussion. • Government finance accounting concept is the accounting basis for reporting central government financial data. For most countries government finance data have been consolidated (C) into one set of accounts capturing all central government fiscal activities. Budgetary central government accounts (B) exclude some central government units. See About the data for tables 4.10, 4.11, and 4.12 for further details. • IMF data dissemination standard shows the countries that subscribe to the IMF's Special Data Dissemination Standard (SDDS) or General Data Dissemination System (GDDS). S refers to countries that subscribe to the SDDS and have posted data on the Dissemination Standards Bulletin Board at http://dsbb.imf.org. G refers to countries that subscribe to the GDDS. The SDDS was established for member countries that have or might seek access to international capital markets to guide them in providing their economic and financial data to the public. The GDDS helps countries disseminate comprehensive, timely, accessible, and reliable economic, financial, and sociodemographic statistics. IMF member countries elect to participate in either the SDDS or the GDDS. Both standards enhance the availability of timely and comprehensive data and therefore contribute to the pursuit of sound macroeconomic policies. The SDDS is also expected to improve the functioning of financial markets. • Latest population census shows the most recent year in which a census was conducted and in which at least preliminary results have been released.

The preliminary results from the very recent censuses could be reflected in timely revisions if basic data are available, such as population by age and sex, as well as the detailed definition of counting, coverage, and completeness. Countries that hold register-based censuses produce similar census tables every 5 or 10 years. Germany's 2001 census is a register-based test census using a sample of 1.2 percent of the population. A rare case, France has been conducting a rolling census every year since 2004; the 1999 general population census was the last to cover the entire population simultaneously (www.insee.fr/en/ recensement/page_accueil_rp.htm). • Latest demographic, education, or health household survey indicates the household surveys used to compile the demographic, education, and health data in section 2. AIS is HIV/AIDS Indicator Survey, CPS is Current Population Survey, DGHS is Demographic and General Health Survey, DHS is Demographic and Health Survey, ENPF is National Family Planning Survey (Encuesta Nacional de Planificacion Familiar), FHS is Family Health Survey, LSMS is Living Standards Measurement Survey, MICS is Multiple Indicator Cluster Survey, MIS is Malaria Indicator Survey, NSS is National Sample Survey on Population Change, PAPFAM is Pan Arab Project for Family Health, RHS is Reproductive Health Survey, and SPA is Service Provision Assessments. Detailed information for AIS, DHS, MIS, and SPA are available at www.measuredhs. com/aboutsurveys; for MICS at www.childinfo.org; and for RHS at www.cdc.gov/reproductivehealth/survevs. • Source of most recent income and expenditure data shows household surveys that collect income and expenditure data. Names and detailed information on household surveys can be found on the website of the International Household Survey Network (www.surveynetwork.org). Core Welfare Indicator Questionnaire Surveys (CWIQ), developed by the World Bank, measure changes in key social indicators for different population groups—specifically indicators of access, utilization, and satisfaction with core social and economic services. Expenditure survey/budget surveys (ES/BS) collect detailed information on household consumption as well as on general demographic, social, and economic characteristics. Integrated household surveys (IHS) collect detailed information on a wide variety of topics, including health, education, economic activities, housing, and utilities. Income surveys (IS) collect information on the income and wealth of households as well as various social and economic characteristics. Labor force surveys (LFS) collect information on employment. unemployment, hours of work, income, and wages. Living Standards Measurement Studies (LSMS),

Primary data documentation notes

developed by the World Bank, provide a comprehensive picture of household welfare and the factors that affect it; they typically incorporate data collection at the individual, household, and community levels. Priority surveys (PS) are a light monitoring survey, designed by the World Bank, for collecting data from a large number of households cost-effectively and quickly. Income tax registers (ITR) provide information on a population's income and allowance, such as gross income, taxable income, and taxes by socioeconomic group. 1-2-3 surveys (1-2-3) are implemented in three phases and collect sociodemographic and employment data, data on the informal sector, and information on living conditions and household consumption. • Vital registration complete identifies countries judged to have at least 90 percent complete registries of vital (birth and death) statistics by the United Nations Statistics Division and reported in Population and Vital Statistics Reports. Countries with complete vital statistics registries may have more accurate and more timely demographic indicators than other countries. • Latest agricultural census shows the most recent year in which an agricultural census was conducted and reported to the Food and Agriculture Organization of the United Nations. · Latest industrial data show the most recent year for which manufacturing value added data at the three-digit level of the International Standard Industrial Classification (ISIC, revision 2 or 3) are available in the United Nations Industrial Development Organization database. • Latest trade data show the most recent year for which structure of merchandise trade data from the United Nations Statistics Division's Commodity Trade (Comtrade) database are available. · Latest water withdrawal data show the most recent year for which data on freshwater withdrawals have been compiled from a variety of sources. See About the data for table 3.5 for more information.

Exceptional reporting periods

In most economies the **fiscal year** is concurrent with the calendar year. Exceptions are shown in the table at right. The ending date reported here is for the fiscal year of the central government. Fiscal years for other levels of government and reporting years for statistical surveys may differ. And some countries that follow a fiscal year report their national accounts data on a calendar year basis as shown in the *reporting period* column.

The **reporting period for national accounts data** is designated as either calendar year basis (CY) or fiscal year basis (FY). Most economies report their

national accounts and balance of payments data using calendar years, but some use fiscal years. In World Development Indicators fiscal year data are assigned to the calendar year that contains the larger share of the fiscal year. If a country's fiscal year ends before June 30, data are shown in the first year of the fiscal period; if the fiscal year ends on or after June 30, data are shown in the second year of the period. Balance of payments data are reported in World Development Indicators by calendar year and so are not comparable to the national accounts data of the countries that report their national accounts on a fiscal year basis.

Economies with exceptional reporting periods

Economy	Fiscal year end	Reporting period for national accounts data
Afghanistan	Mar. 20	FY

Revisions to national accounts data

National accounts data are revised by national statistical offices when methodologies change or data sources improve. National accounts data in *World Development Indicators* are also revised when data sources change. The following notes, while not comprehensive, provide information on revisions from previous data.

- Antigua and Barbuda. The government has revised national accounts data for 1998–2008.
- Bahamas. The government has revised national accounts data for 1997-2007. The new base year is 2006. • Belize. The government has revised national accounts data for 1991-2008. • Bermuda. The Statistical Office has revised national accounts data for 1996-2007. • Croatia. The Statistical Bureau has revised main GDP aggregates for 1995-2005. • Guatemala. The government has revised national accounts data to conform to the 1993 SNA methodology. The new base year is 2001. • Haiti. The government has revised national accounts data following changes in the methodology. Current price series since 1991 and constant price series since 1996 have been revised. The new base year is 1986/87. • Kiribati. The government statistical office has revised national accounts data for 1970-2008. • Lebanon. The government has revised national accounts data for 1997-2007. The new base year is 1997. • Maldives. National accounts data for 2001-08 have been revised to reflect a change in source from the Asian Development Bank to the Maldives Planning Department.
- Mauritius. National accounts now reflect fiscal year data rather than calendar year data. The new base year is 2006. Micronesia, Fed. Sts. The government statistical office has revised national accounts data for 1995–2008. Namibia. The government has revised national accounts data since 2000. The new base year is 2004/05. Serbia. The Statistical Bureau has revised current and constant GDP for 1997–2006. St. Lucia. The government has revised national accounts data for 1998–2008.
- **Uruguay.** The government has revised national accounts data for 1997–2008. The new base year is 2005.

Changes to national currencies

• Slovak Republic. On January 1, 2009, the euro replaced the Slovak koruna as the Slovak Republic's currency. • Turkmenistan. On January 1, 2009, the Turkmen manat was redenominated (1 new manat = 5,000 old manats).

STATISTICAL METHODS

This section describes some of the statistical procedures used in preparing *World Development Indicators*. It covers the methods employed for calculating regional and income group aggregates and for calculating growth rates, and it describes the *World Bank Atlas* method for deriving the conversion factor used to estimate gross national income (GNI) and GNI per capita in U.S. dollars. Other statistical procedures and calculations are described in the *About the data* sections following each table.

Aggregation rules

Aggregates based on the World Bank's regional and income classifications of economies appear at the end of most tables. The countries included in these classifications are shown on the flaps on the front and back covers of the book. Most tables also include the aggregate euro area. This aggregate includes the member states of the Economic and Monetary Union (EMU) of the European Union that have adopted the euro as their currency: Austria, Belgium, Cyprus, Finland, France, Germany, Greece, Ireland, Italy, Luxembourg, Malta, Netherlands, Portugal, Slovak Republic, Slovenia, and Spain. Other classifications, such as the European Union and regional trade blocs, are documented in *About the data* for the tables in which they appear.

Because of missing data, aggregates for groups of economies should be treated as approximations of unknown totals or average values. Regional and income group aggregates are based on the largest available set of data, including values for the 154 economies shown in the main tables, other economies shown in table 1.6, and Taiwan, China. The aggregation rules are intended to yield estimates for a consistent set of economies from one period to the next and for all indicators. Small differences between sums of subgroup aggregates and overall totals and averages may occur because of the approximations used. In addition, compilation errors and data reporting practices may cause discrepancies in theoretically identical aggregates such as world exports and world imports.

Five methods of aggregation are used in World Development Indicators:

- For group and world totals denoted in the tables by a t, missing data are imputed based on the relationship of the sum of available data to the total in the year of the previous estimate. The imputation process works forward and backward from 2000. Missing values in 2000 are imputed using one of several proxy variables for which complete data are available in that year. The imputed value is calculated so that it (or its proxy) bears the same relationship to the total of available data. Imputed values are usually not calculated if missing data account for more than a third of the total in the benchmark year. The variables used as proxies are GNI in U.S. dollars, total population, exports and imports of goods and services in U.S. dollars, and value added in agriculture, industry, manufacturing, and services in U.S. dollars.
- Aggregates marked by an s are sums of available data. Missing values are
 not imputed. Sums are not computed if more than a third of the observations
 in the series or a proxy for the series are missing in a given year.
- Aggregates of ratios are denoted by a w when calculated as weighted averages
 of the ratios (using the value of the denominator or, in some cases, another

indicator as a weight) and denoted by a u when calculated as unweighted averages. The aggregate ratios are based on available data, including data for economies not shown in the main tables. Missing values are assumed to have the same average value as the available data. No aggregate is calculated if missing data account for more than a third of the value of weights in the benchmark year. In a few cases the aggregate ratio may be computed as the ratio of group totals after imputing values for missing data according to the above rules for computing totals.

- Aggregate growth rates are denoted by a w when calculated as a weighted
 average of growth rates. In a few cases growth rates may be computed from
 time series of group totals. Growth rates are not calculated if more than half
 the observations in a period are missing. For further discussion of methods
 of computing growth rates see below.
- Aggregates denoted by an m are medians of the values shown in the table.
 No value is shown if more than half the observations for countries with a population of more than 1 million are missing.

Exceptions to the rules occur throughout the book. Depending on the judgment of World Bank analysts, the aggregates may be based on as little as 50 percent of the available data. In other cases, where missing or excluded values are judged to be small or irrelevant, aggregates are based only on the data shown in the tables.

Growth rates

Growth rates are calculated as annual averages and represented as percentages. Except where noted, growth rates of values are computed from constant price series. Three principal methods are used to calculate growth rates: least squares, exponential endpoint, and geometric endpoint. Rates of change from one period to the next are calculated as proportional changes from the earlier period.

Least squares growth rate. Least squares growth rates are used wherever there is a sufficiently long time series to permit a reliable calculation. No growth rate is calculated if more than half the observations in a period are missing. The least squares growth rate, *r*, is estimated by fitting a linear regression trend line to the logarithmic annual values of the variable in the relevant period. The regression equation takes the form

$$\ln X_t = a + bt$$

which is the logarithmic transformation of the compound growth equation,

$$X_t = X_0 (1 + r)^t$$
.

In this equation X is the variable, t is time, and $a = \ln X_0$ and $b = \ln (1 + r)$ are parameters to be estimated. If b^* is the least-squares estimate of b, then the average annual growth rate, r, is obtained as $[\exp(b^*) - 1]$ and is multiplied by 100

for expression as a percentage. The calculated growth rate is an average rate that is representative of the available observations over the entire period. It does not necessarily match the actual growth rate between any two periods.

Exponential growth rate. The growth rate between two points in time for certain demographic indicators, notably labor force and population, is calculated from the equation

$$r = \ln(p_n/p_0)/n$$

where p_n and p_0 are the last and first observations in the period, n is the number of years in the period, and In is the natural logarithm operator. This growth rate is based on a model of continuous, exponential growth between two points in time. It does not take into account the intermediate values of the series. Nor does it correspond to the annual rate of change measured at a one-year interval, which is given by $(p_n - p_{n-1})/p_{n-1}$.

Geometric growth rate. The geometric growth rate is applicable to compound growth over discrete periods, such as the payment and reinvestment of interest or dividends. Although continuous growth, as modeled by the exponential growth rate, may be more realistic, most economic phenomena are measured only at intervals, in which case the compound growth model is appropriate. The average growth rate over n periods is calculated as

$$r = \exp[\ln(p_n/p_0)/n] - 1.$$

Like the exponential growth rate, it does not take into account intermediate values of the series.

World Bank Atlas method

In calculating GNI and GNI per capita in U.S. dollars for certain operational purposes, the World Bank uses the *Atlas* conversion factor. The purpose of the *Atlas* conversion factor is to reduce the impact of exchange rate fluctuations in the cross-country comparison of national incomes.

The Atlas conversion factor for any year is the average of a country's exchange rate (or alternative conversion factor) for that year and its exchange rates for the two preceding years, adjusted for the difference between the rate of inflation in the country and that in Japan, the United Kingdom, the United States, and the euro area. A country's inflation rate is measured by the change in its GDP deflator.

The inflation rate for Japan, the United Kingdom, the United States, and the euro area, representing international inflation, is measured by the change in the "SDR deflator." (Special drawing rights, or SDRs, are the International Monetary Fund's unit of account.) The SDR deflator is calculated as a weighted average of these countries' GDP deflators in SDR terms, the weights being the amount of each country's currency in one SDR unit. Weights vary over time because both the composition of the SDR and the relative exchange rates for each currency change. The SDR deflator is calculated in SDR terms first and then converted to U.S. dollars using the SDR to dollar *Atlas* conversion factor. The *Atlas* conversion factor is then applied to a country's GNI. The resulting GNI in U.S. dollars is divided by the midyear population to derive GNI per capita.

When official exchange rates are deemed to be unreliable or unrepresentative of the effective exchange rate during a period, an alternative estimate of the exchange rate is used in the *Atlas* formula (see below).

The following formulas describe the calculation of the *Atlas* conversion factor for year *t*:

$$e_{t}^{*} = \frac{1}{3} \left[e_{t-2} \left(\frac{\rho_{t}}{\rho_{t-2}} / \frac{\rho_{t}^{S\$}}{\rho_{t-2}^{S\$}} \right) + e_{t-1} \left(\frac{\rho_{t}}{\rho_{t-1}} / \frac{\rho_{t}^{S\$}}{\rho_{t-1}^{S\$}} \right) + e_{t} \right]$$

and the calculation of GNI per capita in U.S. dollars for year t:

$$Y_t^{\$} = (Y_t/N_t)/e_t^{*}$$

where e_t^* is the Atlas conversion factor (national currency to the U.S. dollar) for year t, e_t is the average annual exchange rate (national currency to the U.S. dollar) for year t, p_t is the GDP deflator for year t, p_t^{S} is the SDR deflator in U.S. dollar terms for year t, $Y_t^{\$}$ is the Atlas GNI per capita in U.S. dollars in year t, Y_t is current GNI (local currency) for year t, and N_t is the midyear population for year t.

Alternative conversion factors

The World Bank systematically assesses the appropriateness of official exchange rates as conversion factors. An alternative conversion factor is used when the official exchange rate is judged to diverge by an exceptionally large margin from the rate effectively applied to domestic transactions of foreign currencies and traded products. This applies to only a small number of countries, as shown in *Primary data documentation*. Alternative conversion factors are used in the *Atlas* methodology and elsewhere in *World Development Indicators* as single-year conversion factors.

CREDITS

1. World view

Section 1 was prepared by a team led by Eric Swanson. Sarwar Lateef and Eric Swanson wrote the introduction with input from Sulekha Patel, Uranbileg Batjargal, and Masako Hiraga. Bhaskar Naidu Kalimili coordinated tables 1.1 and 1.6. Shota Hatakeyama, Mehdi Akhlagi, Raymond Muhula, and Masako Hiraga prepared tables 1.2, 1.3, and 1.5. Uranbileg Batjargal prepared table 1.4, with valuable assistance from Azita Amjadi. Yuri Dikhanov and the International Comparison Program team provided the new estimates of purchasing power parities (PPP), and Sup Lee prepared the special PPP table. Changqing Sun prepared the estimates of gross national income in PPP terms. Luca Bandiera of the World Bank's Economic Policy and Debt Department provided the estimates of debt relief for the Heavily Indebted Poor Countries Debt Initiative and Multilateral Debt Relief Initiative.

2. People

Section 2 was prepared by Sulekha Patel and Shota Hatakeyama in partnership with the World Bank's Human Development Network and the Development Research Group in the Development Economics Vice Presidency. Masako Hiraga and William Prince provided invaluable assistance in data and table preparation, and Kiyomi Horiuchi prepared the demographic estimates and projections. The introduction was written by Sulekha Patel with valuable inputs and comments from Albert Motivans of the United Nations Educational, Scientific, and Cultural Organization Institute for Statistics. Carla AbouZahr from the World Health Organization provided comments during initial discussions, and Sarwar Lateef provided comments on the first draft. The poverty estimates were prepared by Shaohua Chen and and Prem Sangraula of the World Bank's Poverty Monitoring Group and Changquin Sun. The data on children at work were prepared by Lorenzo Guarcello and Furio Rosati from the Understanding Children's Work project. Other contributions were provided by Eduard Bos, Charu Garg, and Emi Suzuki (population, health, and nutrition); Montserrat Pallares-Miralles and Carolina Romero Robayo (vulnerability and security); Lawrence Jeffrey Johnson and Sara Elder of the International Labour Organization (labor force); Juan Cruz Perusia and Olivier Labe of the United Nations Educational, Scientific, and Cultural Organization Institute for Statistics (education and literacy); the World Health Organization's Chandika Indikadahena (health expenditure), Monika Bloessner and Mercedes de Onis (malnutrition and overweight), Neeru Gupta and Teena Kunjument (health workers), Jessica Ho (hospital beds), Rifat Hossain (water and sanitation) and Philippe Glaziou (tuberculosis); Delice Gan of International Diabetes Federation (diabetes); and Nyein Nyein Lwin of the United Nations Children's Fund (health). Eric Swanson provided valuable comments and suggestions on the introduction and at all stages of production.

3. Environment

Section 3 was prepared by Mehdi Akhlaghi in partnership with the World Bank's Sustainable Development Network. Important contributions were made by Carola Fabi and Edward Gillin of the Food and Agriculture Organization of the United

Nations; Ricardo Quercioli of the International Energy Agency; Amy Cassara, Christian Layke, Daniel Prager, and Robin White of the World Resources Institute; Laura Battlebury of the World Conservation Monitoring Centre; and Gerhard Metchies of German Technical Cooperation (GTZ). The World Bank's Environment Department devoted substantial staff resources to the book, for which the team is very grateful. Mehdi Akhlaghi wrote the introduction with valuable comments from Sarwar Lateef, Bruce Ross-Larson, and Eric Swanson. Other contributions were made by Susmita Dasgupta, Kirk Hamilton, Craig Meisner, Brian Blankespoor, Olivier Dupriz, Akiko Saesaka, Kiran Pandey, Giovanni Ruta, and Lopamudra Chakraborti.

4. Economy

Section 4 was prepared by Bala Bhaskar Naidu Kalimili and Soong Sup Lee in close collaboration with the Sustainable Development and Economic Data Team of the World Bank's Development Data Group, led by Soong Sup Lee. Soong Sup Lee wrote the introduction with valuable suggestions from Sarwar Lateef and Eric Swanson, and with assistance from Uranbileg Batjargal and Olga Akcadag. Contributions to the section were provided by Azita Amjadi (trade). The national accounts data for low- and middle-income economies were gathered by the World Bank's regional staff through the annual Unified Survey. Maja Bresslauer, Mahyar Eshragh-Tabary, Victor Gabor, Bala Bhaskar Naidu Kalimili, and Raymond Muhula worked on updating, estimating, and validating the databases for national accounts. The team is grateful to the International Monetary Fund, Organisation for Economic Co-operation and Development, United Nations Industrial Development Organization, and World Trade Organization for access to their databases.

5. States and markets

Section 5 was prepared by David Cieslikowski and Raymond Muhula, in partnership with the World Bank's Financial and Private Sector Development Network, Poverty Reduction and Economic Management Network, Sustainable Development Network, the International Finance Corporation, and external partners. David Cieslikowski wrote the introduction with input from Eric Swanson. Gary Milante and Nadia F. Pittaretti gave valuable advice on the development of the fragile situations table. Other contributors include Ada Karina Izaguirre (privatization and infrastructure projects); Leora Klapper (business registration); Federica Saliola (Enterprise Surveys); Sylvia Solf (Doing Business); Alka Banerjee, Isilay Cabuk, and Nabeel Gadit (Standard & Poor's global stock market indexes); Jeff Wagland of KPMG (tax rates); Satish Mannan (public policies and institutions); Nigel Adderley of the International Institute for Strategic Studies (military personnel); Bjorn Hagelin and Sam Perlo-Freeman of the Stockholm International Peace Research Institute (military expenditures and arms transfers); Kacem laych of the International Road Federation, Ananthanaryan Sainarayan of the Internataional Civil Aviation Organization, and Helene Stephan (transport); Jane Degerlund of Containerisation International (ports); Vanessa Grey and Esperanza Magpantay of the International Telecommunication Union; Ernesto Fernandez Polcuch and Georges Boade of the United Nations Educational, Scientific, and Cultural

Organization Institute for Statistics (research and development, researchers, and technicians); Anders Halvorsen of the World Information Technology and Services Alliance (information and communication technology expenditures); and Ryan Lamb of the World Intellectual Property Organization (patents and trademarks).

6. Global links

Section 6 was prepared by Uranbileg Batjargal in partnership with the Financial Data Team of the World Bank's Development Data Group, Development Research Group (trade), Development Prospects Group (commodity prices and remittances), International Trade Department (trade facilitation), and external partners. Uranbileg Batjargal wrote the introduction, with valuable comments from Eric Swanson. Substantial input for the data and tables came from Azita Amjadi (trade and tariffs) and Yasue Sakuramoto (external debt and financial data). Eric Swanson provided guidance on table contents and organization. Other contributors include Frederic Docquier (emigration rates); Flavine Creppy and Yumiko Mochizuki of the United Nations Conference on Trade and Development, and Francis Ng (trade); Betty Dow (commodity prices); Ciara Browne and Thierry Geiger of the World Economic Forum, Jean François Arvis, Monica Alina Mustra, Philip Schuler, and Vera Wen (trade facilitation); Christine Nashick, Jeff Reynolds, and Joe Siegel of DHL (freight costs); Yasmin Ahmad, Elena Bernaldo, and Aimee Nichols of the Organisation for Economic Co-operation and Development (aid); Akane Hanai and Ibrahim Levent (external debt); Henrik Pilgaard of the United Nations Refugee Agency (refugees); Costanza Giovannelli and Bela Hovy of the United Nations Population Division (migration); Sanket Mohapatra and Ani Rudra Silwal (remittances); and Teresa Ciller of the World Tourism Organization (tourism). Ramgopal Erabelly, Shelley Lai Fu, and William Prince provided valuable technical assistance.

Other parts of the book

Jeff Lecksell of the World Bank's Map Design Unit coordinated preparation of the maps on the inside covers. David Cieslikowski prepared *Users guide*. Eric Swanson wrote *Statistical methods*. Maja Bresslauer, Buyant Erdene Khaltarkhuu, and William Prince prepared *Primary data documentation*. Richard Fix and Alison Kwong prepared *Partners* and *Index of indicators*.

Database management

Mehdi Akhlaghi and William Prince coordinated management of the integrated World Development Indicators database. Operation of the database management system was made possible by Ramgopal Erabelly, Shelley Fu, and Shahin Outadi in the Data and Information Systems Team under the leadership of Reza Farivari.

Design, production, and editing

Richard Fix and Alison Kwong coordinated all stages of production with Communications Development Incorporated, which provided overall design direction, editing, and layout, led by Meta de Coquereaumont, Bruce Ross-Larson, and Christopher Trott. Elaine Wilson created the cover and graphics and typeset the book.

Joseph Caponio provided production assistance. Communications Development's London partner, Peter Grundy of Peter Grundy Art & Design, designed the report. Staff from External Affairs oversaw printing and dissemination of the book.

Client services

The Development Data Group's Client Services and Communications Team (Azita Amjadi, Richard Fix, Buyant Erdene Khaltarkhuu, Alison Kwong, Beatriz Prieto-Oramas, and Vera Wen) contributed to the design and planning and helped coordinate work with the Office of the Publisher.

Administrative assistance, office technology, and systems support

Awatif Abuzeid and Estela Zamora provided administrative assistance. Jean-Pierre Djomalieu, Gytis Kanchas, and Nacer Megherbi provided information technology support. Ramvel Chandrasekaran, Ugendran Makhachkala, and Malarvizhi Veerappan provided systems support on the Development Data Platform application.

Publishing and dissemination

The Office of the Publisher, under the direction of Carlos Rossel, provided valuable assistance throughout the production process. Denise Bergeron, Stephen McGroarty, and Nora Ridolfi coordinated printing and supervised marketing and distribution. Merrell Tuck-Primdahl of the Development Economics Vice President's Office managed the communications strategy.

World Development Indicators CD-ROM

Programming was carried out under the management of Vilas Mandlekar by Abarna Panchapakesan and Sujay Ramasamy. System testing was carried out under the guidance of Azita Amjadi and Vilas Mandlekar and included Buyant Erdene Khaltarkhuu, Parastoo Oloumi, William Prince, and Vera Wen. Systems development was undertaken in the Data and Information Systems Team lead by Reza Farivari. Masako Hiraga produced the social indicators tables. Kiyomi Horiuchi produced the population projection tables. William Prince coordinated user interface design and overall production and provided quality assurance, with assistance from Jomo Tariku. Photo credits belong to the World Bank photo library.

WDI Online

Design, programming, and testing were carried out by Reza Farivari and his team: Azita Amjadi, Ying Chi, Ramgopal Erabelly, Shelley Fu, and Buyant Erdene Khaltarkhuu. William Prince coordinated production and provided quality assurance. Malika Khek and Devika Levy of the Office of the Publisher were responsible for implementation of WDI Online and management of the subscription service.

Client feedback

The team is grateful to the many people who have taken the time to provide assistance on its publications. Their feedback and suggestions have helped improve this year's edition.
